Please supply the ID Number and the Serial Number when ordering replacement parts or requesting service.

We recommend service by Duke Authorized Service Agencies during and after the warranty period.

PRINCIPLES OF OPERATION

The Thermotainer has been designed to preserve hot food at its proper temperature in its own moisture, without the addition of water, steam or circulating fans. The hot air surrounding the food compartment is electrically heated and automatically controlled to maintain the desired temperature. Each cabinet has one or more thermostats depending upon its design and model number. Each compartment has a vent or damper for the control of moist or dry foods.

The primary function of a Thermotainer is for the intermediate storage of hot food after it leaves the cooking unit until it is ready to serve. Thermotainers are not designed to reheat food that has cooled, thawing frozen food, or for cooking. These uses are not recommended.

INSTALLATION

The Thermotainer, when it leaves the factory, is assembled and ready for Installation. The nameplate on the thermostat side of the cabinet contains model number, serial number, volts, hertz, wattage and instructions on the damper operation. The Thermotainer must be connected to the proper electrical power source as indicated on the nameplate. Failure to do this may cause serious damage, prevent proper operation and void the manufacturer's warranty.

The access to the electrical connection box is normally located at the lower front (thermostat side) bottom. It is covered with an access cover panel that is held in place by two screws. Concealed, but adjacent to the right side of the electrical connection box is a wire chase that runs front to back. It is visible by looking underneath the unit. The wire chase permits access to the side knockout of the electrical connection box and to "stub up" or rear connects the electrical power source. Some Thermotainers may be equipped with cords and plugs or the electrical connection box may be in another location depending upon the design and location that may have been specified. It is not necessary to disassemble any part of the Thermotainer to make the electrical connection.

Thermotainers should be moved by carefully lifting underneath and placed in the desired location. They should not be pushed or shoved as this may damage the legs, the hardware, or the electrical components. After setting in place, the Thermotainer must be leveled. If equipped with legs, the adjusting feet should be turned to level the cabinet.

THERMOTAINER® CORD & PLUG SCHEDULE

If legs were not supplied, it may be necessary to shim under the bottom to level. After leveling, with the thermostat (s) in the off position, the Thermotainer can be connected to the electrical power source. Installation must be in accordance with national or local electrical and sanitation codes. In order to remain in compliance with NSF standards, the base must be sealed to the counter or floor. Use General Electric RTV-102, Dow Corning 781 Building Sealant or any silicone based product, which is approved and acts as an adhesive/ sealant.

When the electrical connection is completed, install the stainless steel angle slides inside the compartments. Clean and polish the inside and outside before preheating for the first time. This will assure the factory finish remaining bright for years. See **Care of the** Equipment section of this manual.

Electrical Control

The temperature is maintained by a thermostat (s) that can be adjusted to the desired temperature. The thermostat is directly connected to the heating elements, which in turn heat the air space surrounding each compartment. A thermostat may control one or more compartments depending upon the design.

Each Thermotainer is carefully inspected and tested at the factory. The thermostat (s) are adjusted and calibrated with precision temperature indicating instruments.

The thermostat dial temperature numbers may not necessarily indicate the exact compartment temperature. After it has been determined by use at which setting food keeps best, the thermostat should be kept at this setting to maintain this temperature. Your own experience will be the best guide. Do not constantly change the thermostat setting once it has been determined unless the foods being stored require different temperatures.

NOTE: Thermostats are factory calibrated. Field calibration of the thermostat is not covered by warranty. Preheating

To prevent food spoilage and harmful bacteria growth, food should not be placed in a cold Thermotainer. Preheat by turning the thermostat knob to the desired temperature setting. Allow at least 1-1/2 hours to reach the set temperature.

In heating a cold unit, set the thermostat to the desired temperature. Do not turn to a higher setting as this will waste energy, cause the Thermotainer to be heated above the desired temperature and will not increase the speed of preheating.

OPERATING INSTRUCTIONS

When the operating temperature has been reached, the red pilot light will go out. (It cycles on and off as the temperature varies in the compartment.) The Thermotainer is now ready to accept food for storage. If the food is to be served in the same pan in which it was cooked, it may be left in this pan and placed in the compartment. Otherwise pan food immediately after cooking into another utensil and place in the compartment. The Thermotainer keeps the food in perfect condition during the interval between cooking and serving.

All foods should be placed in the compartment while hot. The use of the Thermotainer for reheating or warming cold food is not recommended. If the Thermotainer is to be used for reheating food, consult a competent food or health authority for information concerning which foods may be cooled and reheated safely.

Most foods can be kept in their best condition at a temperature of approximately 175°F (79.4°C), but the exact temperature will vary with the kind of food and the method of preparation. Minor temperature fluctuations will not affect the quality of most foods. It is not possible to give exact instructions that will fit all conditions. It is suggested that you experiment by increasing or decreasing the temperature until you find the most suitable temperatures for various types of foods. For suggested temperature settings, consult the food storage instruction sheet on page 16.

IMPORTANT HEALTH WARNING: The minimum FDA/NSF temperature for storing hot food is 140°F (60°C). Some local health codes require a minimum of 150°F (65.5°C). Consult your local health code or inspector to determine the minimum safe storage temperature for your area. Storing hot food below 140°F (60°C) may cause the growth of harmful bacteria, which can result in food poisoning.

Some "dry" type food, such as breaded meats, fish, etc., when kept at their proper temperature, require less moisture in the compartment to prevent sogginess. For this reason, all compartments are equipped with vents or dampers. For "dry" type foods the damper should be open. For "moist" type foods the damper should be closed. Refer to the damper operating instructions on the nameplate. Keep the damper in either full open or full closed position depending upon the food being stored. With a little experience, you will soon know the proper position.

Some foods can be kept in good condition much longer than others can, and certain foods cannot be satisfactorily stored in any manner. This depends upon the type of food and method of preparation. Do not expect the impossible from the Thermotainer. If used properly and within its design limitations, it will keep food with less deterioration and for a longer period of time than is possible with other equipment. By maintaining the quality between the time the food is cooked and served, the Thermotainer will assure food being served in the best possible condition.

CARE OF EQUIPMENT

The exterior and compartments should be cleaned daily. Turn off the power before cleaning. Avoid using excessive amounts of water. A damp cloth and any good grease solvent, commercial detergent, or soap should remove any food that has spilled. Do not use harsh scouring powders, steel wool, toxic chemicals, or abrasive cleansers. Thoroughly rinse after using cleaning compounds.

NOTE: Never steam clean or hose down with water. Electric components will fail due to moisture.

If you have been using the compartments with the damper continually open, at least once a week set the thermostat at 200°F (94°C) for several hours with the doors propped open, the dampers open, and the compartments empty. This will drive off any excessive moisture, which may have accumulated in the heater compartment. Remember to turn off the thermostat and close the doors after you have completed this operation.

A. Heating Elements

Should the Thermotainer fail to heat or reach the desired temperature, first check the fuses or circuit breakers in the electrical power line to the Thermotainer. If the fuses or circuit breakers are operating, a qualified electrician, experienced maintenance personnel, or service agency should do further inspection. If you are not qualified to perform service, you may cause damage to the Thermotainer or injure yourself.

To inspect, service, or replace the heating elements, see the accompanying diagrams in this manual. To service, special tools are not necessary. Do not excessively force or jam any parts as Thermotainers are designed for field service and disassembly.

If the fuses or circuit breakers are in operating order, before disassembling to inspect the heating elements, using a voltmeter, check the electrical connections at the connection box, also before and after the thermostat is in its "on" position. This will determine if current is flowing to and through the thermostat. If there is no current flow, the thermostat may have malfunctioned or there may be a break in the wiring circuit. This requires a replacement of the thermostat or repair of the wiring circuit, not a heating element replacement.

If power is flowing through the thermostat, an alternate check can be made with an ammeter. With the thermostat in the "on" position, the ammeter should record amperes approximately equal to the total wattage divided by the voltage. Example: A single phase Thermotainer with a 2750 watt rating at 208 volts

TYPICAL DIAGRAMS SHOWING HOW TO REMOVE COMPARTMENT AND DOORS FOR INSPECTION OR REPLACEMENT OF HEATING ELEMENTS IN THERMOTAINERS

should read about 13.2 ampere. If the reading is much less or zero, one of more heating elements may need replacement.

To use this test you must observe the design of the Thermotainer as to the number of thermostats and location of the heating elements. Thermotainers with only one thermostat have all heating elements located at the bottom of the cabinet in the air space, on either side and between each bottom compartment. Thermotainers with multiple thermostats will have heating elements at various locations depending upon the model.

B.Pilot Lights

- 1. When power is connected to the Thermotainer the amber pilot light will glow continuously. Any interruption of the power source will extinguish the light. This may be caused by power, fuse or circuit breaker failure. The amber pilot light will continue to glow after the thermostat and heating elements shut off and the Thermotainer is not in use. The cost of pilot light operation is negligible. Make no attempt to remove or shut it off it is an added protection.
- 2. The red pilot light will glow when the thermostat is turned on and will go off and on as the thermostat cycles to maintain the temperature setting selected. When the red pilot light does not glow after cycling, the Thermotainer is at the set temperature.
- 3. Removal and replacement of pilot lights and thermostats are covered in the **Thermostat Recalibration Instruction** section of this manual.

C.To Adjust Hinges

The exclusive Thermotainer adjustable stop hinge is specially designed to provide sanitary construction and to withstand rugged service. It will easily support all reasonable and normal loads placed upon the door. Should tension of the internal concealed spring be lessened by use, the hinge can be easily adjusted with a thin rod, such as an ice pick or a piece of wire coat hanger. Simply place the end of the rod in one of the tension adjustment holes and rotate the assembly

upward, resetting the set pin when the proper tension is reached. Be careful not to adjust the spring tension too tightly. Usually resetting the set pin one hole is adequate. When the spring is properly adjusted, the doors will close firmly without slamming. Too much spring tension will cause the doors to slam and may result in premature failure of the door or hinge parts.

The hinge has been designed so all parts are replaceable. It is usually not necessary to order a complete replacement hinge. The parts list in the back of this manual illustrates and lists all the hinge parts. By only ordering parts that need replacement, maintenance costs can be reduced.

CAUTION: The hinges and doors are not intended to serve as stepladders or to support abnormal loads. They will support the weight of food products normally encountered in food service.

To Remove Door

- 1. Release spring tension on hinges.
- 2. Remove the three countersunk screws on each side of the inner door panel attaching the door to the hinge. Pull door loose from the hinge plates.

To Reinstall Door

Slide hinge plates into slots at bottom of the door and align countersunk holes in door with tapped holes in hinge plate. Install screws firmly using a thread tightening compound. Reset spring tension.

To Remove Hinge Assembly

Thermotainer's exclusive hinge is designed so all parts are removable. It is not necessary to replace the complete hinge, only the part that requires replacement.

- 1. Release the spring tension by removing the set pin, Part TA-10. See Illustration,
- 2. Remove screw and lock washer in the end of the barrel cap nut and pull cap off the shaft. Using a small rod or screwdriver, drive the shaft and cap out of the barrel, or pry out with a screwdriver from the capped end.
- 3. If only internal parts are to be replaced, pull door out far enough to push parts out of the barrel, replace parts, and reassemble, reversing the above procedure.
- 4. If the entire hinge is to be replaced, proceed as in Items 1 and 2 above, then remove hinge plate as in **To Remove Door** instructions.
- 5. To remove the hinge base plate from the front of the cabinet, proceed as in Items 1 and 2 to gain access to the attaching screws. Remove screws.
- 6. To install a complete hinge assembly including the hinge base plate:
 - a. Reverse procedure in Item 5.
 - b. Reverse procedure in **To Remove Door** instructions.
 - c. Use procedure in Item 3
 - d. Hold internal parts in the barrel and insert base plate.
 - e. Insert shaft with cap.
 - f. Install cap, lock washer and screw. Tighten screw securely using thread-locking compound.
 - g. Set spring tension and install lock pin as instructed in To Adjust Hinge.

D. To Remove Damper Assembly

- 1. If the Thermotainer has only one thermostat, remove the compartment directly above the damper, or if a pass-thru model, the front (thermostat side) of the compartment. If the damper is for the top compartment, remove the top panel. If the Thermotainer has a thermostat controlling each compartment, remove the compartment below the damper.
- 2. Remove the two screws attaching the actuating mechanism to the front of the inner liner.
- 3. Flex the damper rod sufficiently to slide the rear end out of the retaining hole. Then, moving the assembly toward the corner of the cabinet, flex the rod to allow push buttons to slide free of the front liner.

CAUTION: Flex the rod gently so it does not become permanently bent or damaged. Lift free of cabinet. To reinstall, reverse this procedure. If rod becomes bent, straighten rod after reinstalling.

4. To remove the push buttons, grasp button firmly with pliers and with a slight twisting motion, pull knob off in a straight direction. To install a new push button, place the hole in the push button over the end on the rod and gently push button on rod until it stops. Do not use excessive force when grasping, pulling, or pushing the button, as it will break.

E. To Replace Pilot Lights or Thermostats

- 1. Shut off electric power to the Thermotainer.
- 2. Pull off the thermostat control knob.
- 3. Remove two screws at either end of the control panel and pull control panel out of cabinet. If the Thermotainer has a flush top panel with a turned down edge, slide the control panel from under the edge.
- 4. Remove two screws that hold the thermostat to the control panel, disconnect wiring, and pull the thermostat capillary tube and bulb straight out of the cabinet.
- 5. Pry lock nut off the back of the pilot light and pull pilot light out through front of control panel after disconnecting the wire to the pilot light.
- 6. To replace thermostat or pilot light, reverse this procedure. After installing a new thermostat, it should be checked with a thermometer.

TROUBLESHOOTING

PROBLEM	CAUSE	CORRECTION
Doors do not close. Drop Door models only.	Hinge tension needs adjustment or replacement of springs.	Adjust spring tension by removing TA-10 set pin and rotating TA-9 adjuster upward one or two holes. Reset TA-10 set pin. Do not over-tighten spring. If adjuster does not tighten spring, disassemble hinge and replace TA-3 spring. See To Adjust Hinge section.
Compartment not heating.	Failure at power source. Defective thermostat. Defective heating elements. Broken wire. Disconnected element terminal.	Check fuses or circuit breakers. Check connections in junction box. If amber pilot light is glowing, there is power up to the thermostat. If red pilot light is glowing, there is power after thermostat. If red pilot light is off, first test pilot light. If operative, replace thermostat. If both pilot lights are glowing, check circuit for broken wire or loose terminal if none of these, remove compartment and replace heating element located on each side of the bottom air space surrounding compartment. See Heating Element section.
Compartment overheating.	Thermostat defective or requires recalibration.	Recalibrate thermostat in accordance with instructions. If recalibration does not eliminate overheating, replace thermostat.

RECOMMENDED FOOD STORAGE PERIODS

	Longest	Average	Approximate
	Time	Time	Temperature
Crisp or Dry Foods	<u>Kept</u>	<u>Kept</u>	$\underline{\mathbf{F^o}}$
Baked potatoes	2 hrs.	30 min.	175-200

IMPORTANT: Above times and temperatures are meant to serve only as a guide. Types of food, methods of preparation, quantity, recipes, etc., will affect holding time and food quality. Experimentation on the part of the user will determine best results

All foods should be placed in the compartment hot. The use of the Thermotainer® for reheating food that has cooled or has been refrigerated is not recommended. If foods are to be reheated, consult a competent food or health authority for information concerning foods, which may be cooled and reheated safely.

PARTS LIST

IMPORTANT: State serial number, model number and complete electrical information when ordering parts. THE COMPANY WILL NOT BE RESPONSIBLE FOR OPERATION OF THE APPLIANCE UNLESS AUTHORIZED FACTORY PARTS ARE USED WHEN REPLACEMENTS ARE REQUIRED.
