I. GENERAL INFORMATION

I. a - HOW TO USE THIS MANUAL:

Traulsen provides this manual as an aid to the service technician in installation, operation, and maintenance of INTELA-TRAUL® Controllers. When used properly, this service manual can help the service technician maintain, troubleshoot and diagnose most of the problems and malfunctions that may occur with the Controllers

This manual covers the four different types of Controllers (Full Size Undercounter, G-Series, R&A Series Refrigerator & Freezer, and R&A Series Hot Food). These vary slightly from one another, all exceptions are noted, and where appropriate septions are provided.

While we believe that most aspects of the controllers are covered in this manual, should you encounter a condition not addressed, or require a wiring diagram please contact:

All service communication must include:

- Model Number & Serial Number Of Unit
- A detailed explanation of the problem

I. b - ABOUT INTELA-TRAUL:

The Traulsen INTELA-TRAUL and G-Series microprocessor controls are microprocessor based systems which replace several electromechanical components typically built into refrigeration products, such as: time clocks, thermometers, defrost limit switches and temperature controls, all combined into one solid state modular unit.

These microprocessor controls both monitor a cabinet air sensor and a coil sensor. The INTELA-TRAUL on the R & A Series also includes a discharge line sensor and a relative humidity sensor (H1 versions only). In conjuction with the programmed parameters of the control, and the information received, it cycles the refrigeration system ON and OFF at set temperatures, initiates and/or terminates defrost cycles, and initiates one of several alarm features if a problem is sensed (R & A Series only). R & A Series controls also allow the operator to cycle the door perimeter heaters ON/OFF as needed.

I. c - OPERATING THE CONTROLLER:

When operating the controller it is important to note that you only have approximately 20-30 seconds between button pushes. If you take longer than 30 seconds, the controller will revert back to displaying the cabinet temperature. If you enter the wrong security code, the controller will revert back to displaying the cabinet temperature. You can exit the parameters at any time by waiting 20-30 seconds for the control to return to normal operation.

II. BASIC SERVICE PROCEDURES

II. a - ADJUSTING THE TEMPERATURE:	The Display Will Read
Step 1: Press . Display will read "CUS."	CUS
Step 2: Press Display will read "000" with the left digit flashing.	000
Step 3: Press 5. Display will read "000" with the center digit flashing.	000
Step 4: Press until the center digit changes to an "A".	ORC
Step 5: Press Sip. Display will read "0A0" with the right digit flashing.	ORO
Step 6: Press until the right digit changes to an "1".	08 t
Step 7: Press [55]. Display will read "SPH".	SPX
Step 8: Press again.	
Step 9: Press or to adjust temperature to desired setting.	
(NOTE: SPH should be set at 38 to 40°F for refrigerators and 0°F for free	ezers)
Step 10: When display reads the desired temperature press .	380
Step 11: Press until display reads "SPL".	SPL
Step 12: Press SET .	
Step 13: Press or to adjust temperature to desired setting.	340
(NOTE: SPL should be set at 34°F for refrigerators and -4°F for freeze	ers)
Step 14: Press SET .	
Step 15: Press to exit (R & A Series only). On G-Series models the	
controller will automatically revert back to normal temperature display ope	eration

after a delay of approximately 20-30 seconds.

II. BASIC SERVICE PROCEDURES

II. b - STARTING A MANUAL DEFROST CYCLE (R & A Series):

The Display Road

Step 1: Press . Display will read "CUS."

Step 2: Press . Display will read "000" with the left digit flashing.

Step 3: Press . Display will read "000" with the center digit flashing.

Step 4: Press . Display will read "000" with the center digit flashing.

Step 5: Press . Display will read "0A0" with the right digit flashing.

Step 6: Press . Display will read "0A0" with the right digit flashing.

Step 7: Press . Display will read "SPH".

Step 8: Press . Display will read "SPH".

Step 9: Press . Display will read "n" (NO).

Step 10: Press . Display will read "4" (YES).

Step 11: Press . Controller will display "SPH" for 30 seconds and

then "DEF" will appear.

NOTE: The controller will automatically revert back to normal operation after a delay of approximately 20-30 seconds.

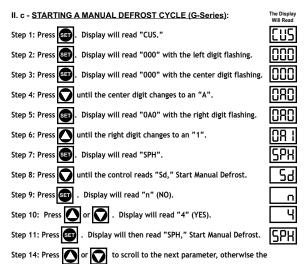

FREEZER

NOTE:

Traulsen R & A Series refrigerator models also include an offcycle defrost feature, which occurs once an hour. This is indicated by the control display, is time or temperature terminated, and generally is of 3 - 10 minutes in duration.

DEFROST ICON

II. BASIC SERVICE PROCEDURES

controller will automatically revert back to normal operation after a delay of approximately 20-30 seconds.

NOTE:

Traulsen G-Series refrigerator models also include an off-cycle defrost feature, which occurs once an hour. This is indicated by the control display, is time terminated, and is generally of 3 - 10 minutes in duration.

The defrost cycle on Traulsen G-Series freezer models can be either time or temperature terminated.

DEFROST ICON

III. a - CHECKING FOR DEFECTIVE SENSORS:

Step 1: Press ser . Display will read "CUS."

Step 2: Press st. Display will read "000" with the left digit flashing.

. Display will read "000" with the center digit flashing.

until the center digit changes to an "A".

. Display will read "OAO" with the right digit flashing.

Step 6: Press until the right digit changes to an "1".

Step 7: Press SE

Step 8: Press until display reads "EL". Press ser

If the display now reads "-40," check for loose connection on the EVAPORATOR

sensor. If the display has a very high reading such as "266," replace the evaporator sensor. NOTE:

Erroneous readings may be the result of a faulty sensing circuit (open or shorted) in the Controller.

Step 9: Press until the display reads "DL1". Press

In the event that the display now reads "-40," check for a loose connection on the DISCHARGE LINE sensor. If the display has a reading of "220" or higher, check for lack of adequate air-flow through the condenser, a bad condenser motor, or any other

condition around the unit which could cause a high temperature, such as a steam table or a crossdraft. Otherwise, proceed with replacing the DISCHARGE LINE sensor. NOTE: Erroneous readings may be the result of a faulty sensing circuit (open or

shorted) in the Controller.

Step 10: Press until the display reads "AA2". Press ser

The Display

Will Read

Display should read the approximate ambient air temperature behind the louver panel. If the display reads "111" check for a loose connection on the RH/AMBIENT AIR sensor. If the display reads "32.0" check the sensor for a short circuit.

NOTE: If display reads -40 or 266 the cabinet sensor is defective and requires replacement.

NOTE: Ambient Air Sensor not included on MIT version controllers.

NOTE: Erroneous readings may be the result of a faulty sensing circuit (open or shorted) in the Controller (on H1 control version only).

1= DL is not included on G-Series controllers.

2= AA is not available with MIT version controllers.

III. b - CHECKING FOR FAILED RELAYS:

Checking For A Failed Internal Controller Relay:

- Gain access to Controller compressor relay (see REMOVAL INSTRUCTIONS within this service manual for the specific type of controller your are servicing).
- Locate the connector with the black/blue/purple wires and unplug it. Refer to the schematic on the side of the controller, or refer to the appropriate wiring diagram (to obtain this please contact the factory, referencing the serial number of the unit involved).
- 3. Using a volt/ohm meter (VOM) with the power OFF, check the resistance across the black to blue wires of the Controller connector. If completed circuit is indicated (with no power to the Controller), the contacts are stuck closed and the Controller should be replaced (on MIT versions either the relay box or one of the other relays within the unit need to be replaced).

Checking For A Failed External "Slave" Relay or Solid State Relay (SSR), p/n 337-60360-01 (MIT II Only):

- Gain access to the controller compressor relay (see REMOVAL INSTRUCTIONS within this service manual for the specific type of controller your are servicing).
- 2. Locate the external "slave" relay and unplug the harness connectors.
- Using a volt/ohm meter (VOM), check the resistance from the "COM" terminal to the "NO" terminal. If a completed circuit is indicated, the contacts are stuck closed and the slave relay should be replaced.
- 4. For the SSR, remove the black and blue wires from terminals 3 & 4. Using a volt/ohm meter, and with the power OFF, measure the resistance across the terminals. A completed circuit indicates that the circuit is closed and that the relay should be replaced. A reading of 25 m Ω to 35 m Ω is considered normal for an open circuit in the SSR.

Checking For A Failed Door/Light Relay (R & A Series models only):

- Gain access to Controller door relay (see REMOVAL INSTRUCTIONS within this service manual for the specific type of controller your are servicing).
- 2. Remove the wire from the door relay coil.
- Using a volt/ohm meter (VOM), check across the relay contacts. If an open across the contacts is not indicated, replace the door relay.

NOTE: Equipment manufactured with the MIT II controller version do not include a Door/Light relay).

Physically check the switch for evidence of water. If switch has water in it, proceed with replacing the switch.

III. c - CHECKING FOR OTHER FAILED COMPONENTS:

Checking For A Failed Door Switch:

- 1. Remove the door(s) from the unit involved.
- 2. Locate the door switch, which is located behind the top door hinge(s).
- 3. Remove the switch from the cabinet.
- Using a volt/ohm meter (VOM), check across the switch contacts. "COM" to "NO" should read open. If not, replace the switch.
- 5. Reinstall the switch and hinge onto the cabinet.

NOTE: If the unit has more than one door, check ALL door switches in the same manner as described in steps 1 thru 5 above.

Checking For A Failed Controller Transformer (H1 & MIT I control versions only):

 Check incoming voltage. Voltage at the unit must be within the ranges shown in the table below.

VOLTAGE						
MIN	MAX	STANDARD				
104 VAC	126 VAC	115/60/1				
187 VAC	253 VAC	208-230/60/1				
10.2 Volts	13.8 Volts	Transformer				
(MIT 12.4)	(MIT 14.7)	Output Voltage				

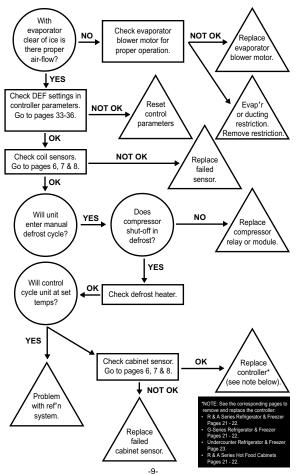

- If the controller display does not come back on, use a volt/ohm meter (VOM) and check the output voltage of the controller transformer.
- If the output voltage from the transformer is not within the range shown in the table above, replace the transformer. If the transformer tests OK, replace the controller instead.
- 4. For equipment manufactured with the MIT II controller version the transformer is mounted inside the relay module. Check between 17 and 8 on 18 pin connector on relay module for 12V DC.

Checking Cabinet, Coil or Discharge Line Sensors:

- Gain access to CABINET, COIL or DISCHARGE LINE sensor and disconnect it.
- 2. Place tip if sensor probe in a mixture of icewater for several minutes.

 Allow enough time for sensor probe to aclimate to the icewater.
- 3. At 32°F, probe resistance should be 32.7K Ohms, +/- 10%. If resistance is not within this range, repalce the sensor.

III. d - CHECKING FOR ICED EVAPORATOR COIL:

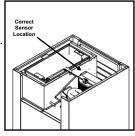

III. e - PROPER SENSOR PLACEMENT:

Coil Sensor:

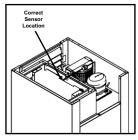

The coil sensor should be inserted into the return air side of the evaporator coil. On freezer models only this sensor should be centered approximately 2" (two inches) from the top (horizontally through coil - centered in coil).

On refrigerator models this sensor should be mounted on top of the coil.

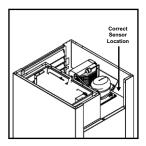

Cabinet Air Sensor:

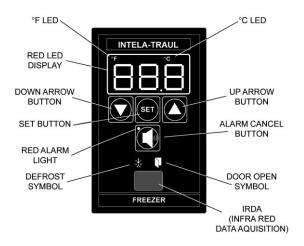

The cabinet air sensor should be mounted inside the evaporator housing (hump) on the return air side of the evaporator coil.

Discharge Sensor (R & A Series Only):
The discharge air sensor should be mounted on the hot gas side of the compressor. Placement should be as close to the compressor as possible and must be placed prior to the beginning of the hot gas loop. Please note that discharge sensors must be insulated.

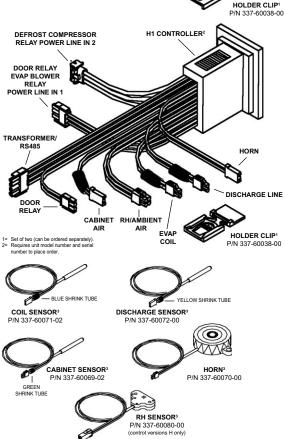

IV. a - R & A SERIES REFRIGERATOR & FREEZER VERTICAL CONTROLLER:

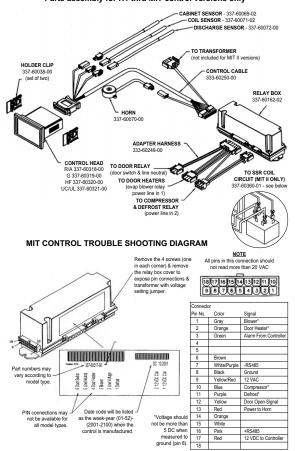

NOTES: IRDA not included on equipment manufactured with the MIT II control version.

See parts assembly on pages 12-13.

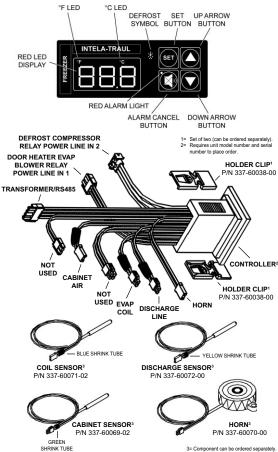

-12-

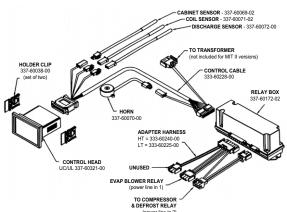

IV. b - R & A SERIES REFRIGERATOR & FREEZER VERTICAL CONTROLLER: Parts assembly for H1 thru MIT control versions only

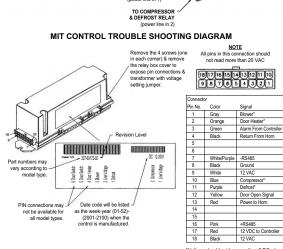

IV. c - UC & UL (UNDERCOUNTER) HORIZONTAL CONTROLLER:

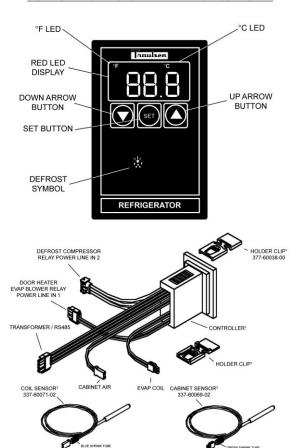

IV. c - <u>UC & UL (UNDERCOUNTER)</u> HORIZONTAL CONTROLLER: Parts assembly for MIT control version only

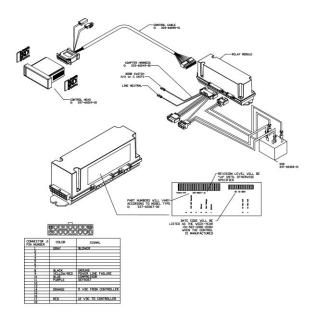

^{*}Voltage should not be more than 5 DC when measured to ground (pin 8).

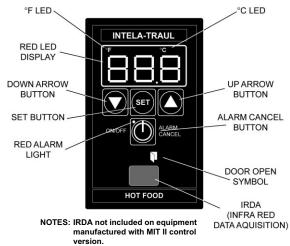

IV. d - G-SERIES REFRIGERATOR & FREEZER VERTICAL CONTROLLER:

IV. d - G-SERIES REFRIGERATOR & FREEZER VERTICAL CONTROLLER:

IV. e - R-SERIES HEATED CABINET VERTICAL CONTROLLER:

See parts assembly on pages 17-18.

HOT FOOD CABINET START-UP (pre-MIT version):

When power is first applied to the unit, you must set the temperature by pressing the "SET" and "UP ARROW" buttons at the same time using equal pressure with both thumbs, until the temperature appears on the display. Next, use the "UP" button to reach the desired temperature (maximum 180°), then press and release the "SET" button to lock it in.

After this is done you can turn the control ON and OFF by pressing and releasing the "ALARM CANCEL" button.

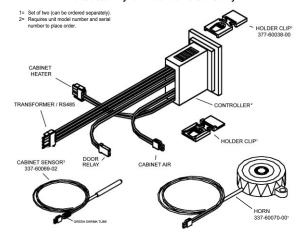

Be aware to watch for the display constantly reading "OFF". This is an indication of a possible faulty cabinet sensor. To remedy, replace the sensor and reset the operating temperature.

HOT FOOD CABINET START-UP (MIT version):

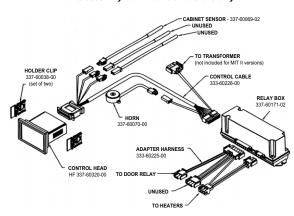

The MIT control offers an additional means of turning the cabinet heaters ON and OFF. After the operating temperature has been set, the operator can continuously turn the unit OFF and then back ON again to the same operating temperature by pressing the "ON/OFF" button on the face of the control.

Please note that this feature will not function if the control is in an alarm state with the alarm LED illuminated.

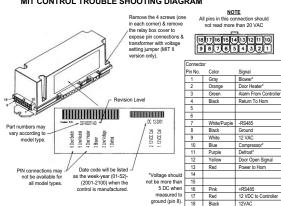

IV. e - R-SERIES HEATED CABINET VERTICAL CONTROLLER: Parts assembly for H1 control versions only

IV. e - R-SERIES HEATED CABINET VERTICAL CONTROLLER: Parts assembly for MIT control versions only

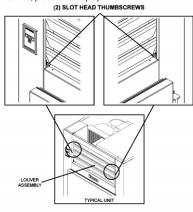

MIT CONTROL TROUBLE SHOOTING DIAGRAM

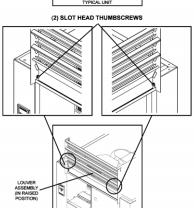

V. REMOVAL/INSTALLATION

V. a - ALL VERTICAL CONTROLLERS:

To remove INTELA-TRAUL® (p/n's 337-60090-00, 337-60091-00 and 337-60092-00) and G-Series (p/n's 337-60093-00, 337-60094-00 and 337-60095-00) Vertical Controller from the unit in which it is installed, proceed as follows (If unable to access the unit from the rear perform steps 1 through 3, otherwise, proceed to step 4):

 At front of unit, remove two (2) slot head thumb screws from bottom corners of louver assembly. Set thumbscrews aside

- Swing louver assembly up and away from front of unit until it stops.
- Remove two (2)
 Slot head thumbscrews from top of louver assembly.
 Set thumbscrews and louver assembly aside.

V. REMOVAL/INSTALLATION

WARNING: DISCONNECT ALL POWER BEFORE PROCEEDING

CONNECTIONS

CONTROLLER

- At the top of the junction box, remove three (3) Phillips head screws. Set screws aside.
- Locate one (1) Phillips head screw at bottom of junction box, and remove. Set screw aside.
- JUNCTION (3) PHILLIPS
 HEAD SCREWS

 (1) PHILLIPS
 HEAD SCREWS

 (1) PHILLIPS
 HEAD SCREW
 OF UNIT

JUNCTION

BOX

(relay junction

box shown turned 90 degrees)

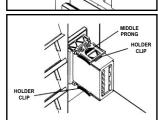

- Carefully slide junction box away from front of unit until all wiring and connections to the controller are exposed.
- Locate all nine (9) Controller connections (five for G-Series), then carefully disconnect each one.
- Firmly grasp and compress the rounded portion of the middle prong on each holder clip.
 Slowly slide each holder clip off the controller. Set clips aside.

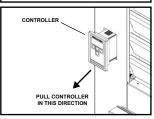

NOTE:

Be sure ALL components have been disconnected from the Controller before performing the next step.

Slowly pull Controller through mounting hole and set aside.

TO RE-INSTALL CONTROLLER, REVERSE THE PRECEEDING PROCEDURE.

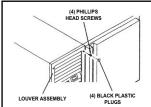

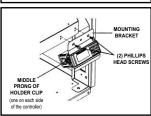

V. REMOVAL/INSTALLATION

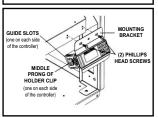

V. a - ALL HORIZONTAL CONTROLLERS:

To remove INTELA-TRAUL® (p/n's 337-60096-00 and 337-60097-00) Horizontal Controller from the unit in which it is installed, proceed as follows:

WARNING: DISCONNECT ALL POWER BEFORE PROCEEDING

- Check to make sure that the power cable is disconnected from the wall.
- Remove the four (4) black plugs that are located in each corner of the power pack louver assembly. Set plugs aside.
- Remove the four (4) Phillips head screws holding the louver assembly in place. Set screws and louver assembly aside.
- Remove the two (2) Phillips head screws thathold the Controller and the bracket assembly to the condenser fan assembly. Set screws aside.
- Locate all nine (9) Controller connections, then carefully disconnect each one.
- Firmly grasp and compress the rounded portion of the middle prong on each holder clip.
 Slowly slide each holder clip off the Controller. Set clips aside.

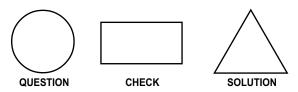

TO RE-INSTALL CONTROLLER, REVERSE THE PRECEDING PROCEDURE.

VI. PROBLEM DIAGNOSIS

VI. a - HOW TO USE THE TROUBLESHOOTING TREES:

The troubleshooting trees on the following pages were developed as an aid to the service technician in determining the exact solution to a certain problem or malfunction. When used as designed, the troubleshooting trees can lead you from a general symptom to the most likely component to suspect as the cause of the problem.

The trees are made up of three different types of boxes:

QUESTION

Boxes ask a yes/no question and the answer will lead to either another question box, a check box, or a solution box.

CHECK

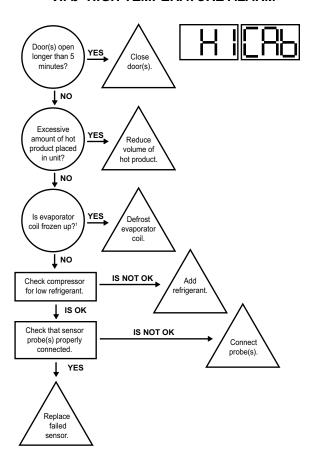

Boxes will suggest a point to check for proper operation, and will often refer you to a page in either the SERVICE INFORMATION or the REMOVAL/INSTALLATION sections of this manual. The result of the check may lead to another box, or a solution box

SOLUTION

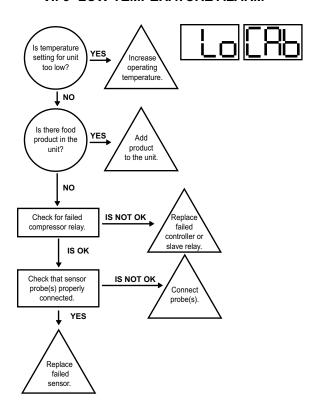

Boxes suggest the most likely component to cause the malfunction described in the heading of the tree. When reaching a solution box, do not immediately assume the component is defective. The final step is to use the SERVICE INFORMATION section of this manual to verify that the component is defective.

To use the troubleshooting trees, first find the page with the heading describing the type of problem occurring. Begin at the top of the page and follow the tree, step-by-step. When a check box is reached, refer to the suggested section to make the check suggested. Once a solution box is reached, refer to the suggested section to verify that the component in the solution box is indeed defective, and repair or replace per the direction in that section.

VI. b- HIGH TEMPERATURE ALARM

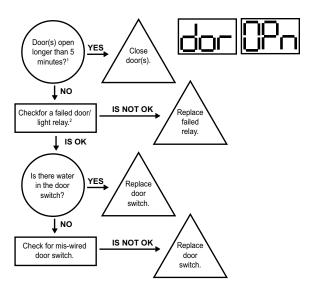

VI. c- LOW TEMPERATURE ALARM

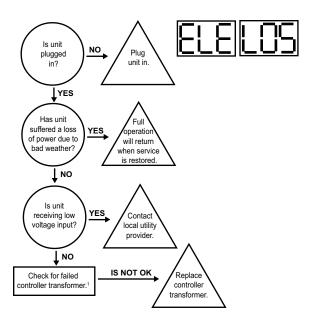

NOTE ON HOT FOOD UNITS ONLY

Hot food units are designed to hold hot food at set temperature. The cabinet is not designed to heat cold products.

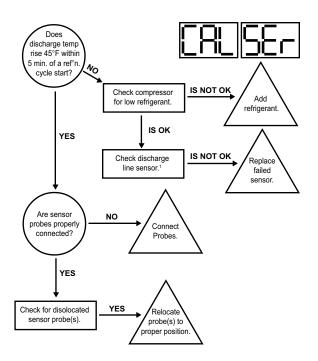

VI. d- DOOR OPEN ALARM

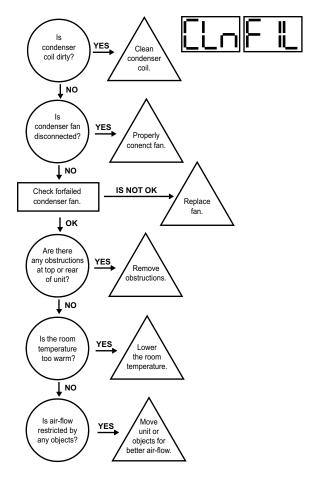

VI. e- POWER LOSS ALARM

VI. f- SYSTEM LEAK ALARM

VI. g - CONDENSERCLEAN ALARM

VII. ACCESSING THE ENGINEERING LEVEL

VII. a - ACCESSING THE ENGINEERING LEVEL:

Not all control parameters can be adjusted at the customers level of access. To adjust these other parameters it is first necessary to gain access to the ENGINEERING LEVEL. Please follow the below procedure in order to enter this level.

The Display Will Read . Display will read "CUS." Step 1: Press SET Step 2: Press until "EnG" is displayed. . Display will read "000" with the left digit flashing. Step 3: Press SET until the left digit changes to an "9". . Display will read "900" with the center digit flashing. Step 5: Press SET until the center digit changes to an "9". Step 6: Press . Display will read "990" with the right digit flashing. until the right digit changes to an "E". Step 9: The display will read (99E), press SET Step 10: Press . The display will now read "FOC" - See Note.

NOTE: R & A Series Only, for G-Series models press for the

VIII. a - PARAMETER DESCRIPTIONS:

- FOC 3-digit code which identifies the .hex file loaded at the factory.
- ADR Device address for NAFEM networks.
- BAU Communications rate when connected into a NAFEM network.
- NAF Allow the control to communicate with a NAFEM network.
- SPH High value of desired cabinet temperature range.
- SPL Low value of desired cabinet temperature range.
- SHL Lowest temperature of allowed range for setting of SPH.
- SHH Highest temperature of allowed range for setting of SPH.
- SLL Lowest temperature of allowed range for setting of SPL.
- SLH Highest temperature of allowed range for setting of SPL.
- RO Difference, in degrees, between displayed & measured temperature.
- HI The highest temperature the cabinet air temperature is allowed to reach before triggering a High-Temp alarm.
- LO The lowest temperature the cabinet air temperature is allowed to reach before triggering a Low-Temp alarm.
- SCL Sets the temperature display scale (fahrenheit or celsius).
- HAD Time, in minutes, that the controller delays triggering the High-Temp alarm at any start-up or at the end of a defrost cycle.
- LAD Time, in minutes, that the controller delays triggering the Low-Temp alarm if cabinet air temperature equal or below SPL setting.
- AC The amount of time, in minutes, that the compressor must be off between cycles.
- DEF Defines the type of heat used to defrost the coil: Electric, Hot Gas, None or Off-Cycle.
- IBD The amount of time, in hours, between the end of the drip time& start of the next defrost cycle.
- DDC The maximum amount of time, in minutes, that the heat will be on during a defrost cycle.
- CDE The temperature of the evaporator coil that indicates the end of a defrost heat cvcle.
- DDE The amount of time, in minutes, between the defrost heat being turned off and the compressor turning on.
- BDD The delay time, in minutes, between the end of the drip time and and before the evaporator blower turns on.
- BSD The temperature of the evaporator coil that triggers the evaporator blower to turn on after drip time ends.
- ODD The maximum amount of time, in minutes, that the display will read the last temperature recorded before entering the defrost cycle.
- SD Allows a techinician to start or stop a defrost cycle.
- CFA Alows the customer to turn the clogged filter alram ON/OFF (R & A Series only).
- CCR The minium amount of time, in minutes, that the compressor must be running before generating a clogged filter alarm.
- CDL The discharge line temperature that will trigger a clogged filter alarm.
- DOA Allows the customer to turn the door open alarm ON/OFF in units equipped with the appropriate hardware.
- DAD The time, in minutes, that a door must be open before triggering a door open alarm.

VIII. a - PARAMETER DESCRIPTIONS (continued):

- APD The amount of time, in seconds, that a visual alarm text will be displayed.
- ATD Alarm temperature delay.
- AAS Allows the customer to set the type of audible alarm style, either Blast, OFF or Continuous.
- CL Allows the customer to set the time of day.
- DAY Allows the customer to set the date.
- DS Sets daylight savings time On or OFF.
- DL1 Selects the time to start a defrost lockout.
- DL2 Selects the time to start a defrost lockout.
- DL3 Selects the time to start a defrost lockout.
- DL4 Selects the time to start a defrost lockout
- DCF Allows the customer to set the percentage of time that the door perimeter heaters will operate, to control surface condensation.
- CON The amount of time the compressor will run in the event of a cabinet air sensor failure.
- COF The amount of time, in minutes, that the compressor will be OFF in the event of a cabinet air sensor failure.
- EL Displays the evaporator temperature at the time (press set or the up arrow button to display this feature).
- DL Displays the discharge line temperature at the time (press set or the up arrow button to display this feature).
- CB When activated (by pressing the set or up arrow buttons), will display the cabinet air temperature at the time the button is pressed.
- PLn When activated will display the approximate line voltage.
- RCO Will energize the compressor relay for 10 seconds when activated.
- RdF Will energize the heater relay for 10 seconds when activated.

 RFA Will energize the blower relay for 10 seconds when activated.
- RFA Will energize the blower relay for 10 seconds when activated.

 RDH Will energize the door heater relay for 10 seconds when activated.
- Pro Parameter used only when reflashing the program memory.
- CEP When activated, will return all of the parameters to the initial factory settings.
- REF Displays the revision level of the software loaded into memory.
