(OVENS WITH PUSH BUTTON CONTROLS)**

MODEL 1116-000-A	NAT. GAS	120VAC	60 HZ. 1 PHASE
MODEL 1117-000-A	LP GAS	120VAC	60 HZ. 1 PHASE

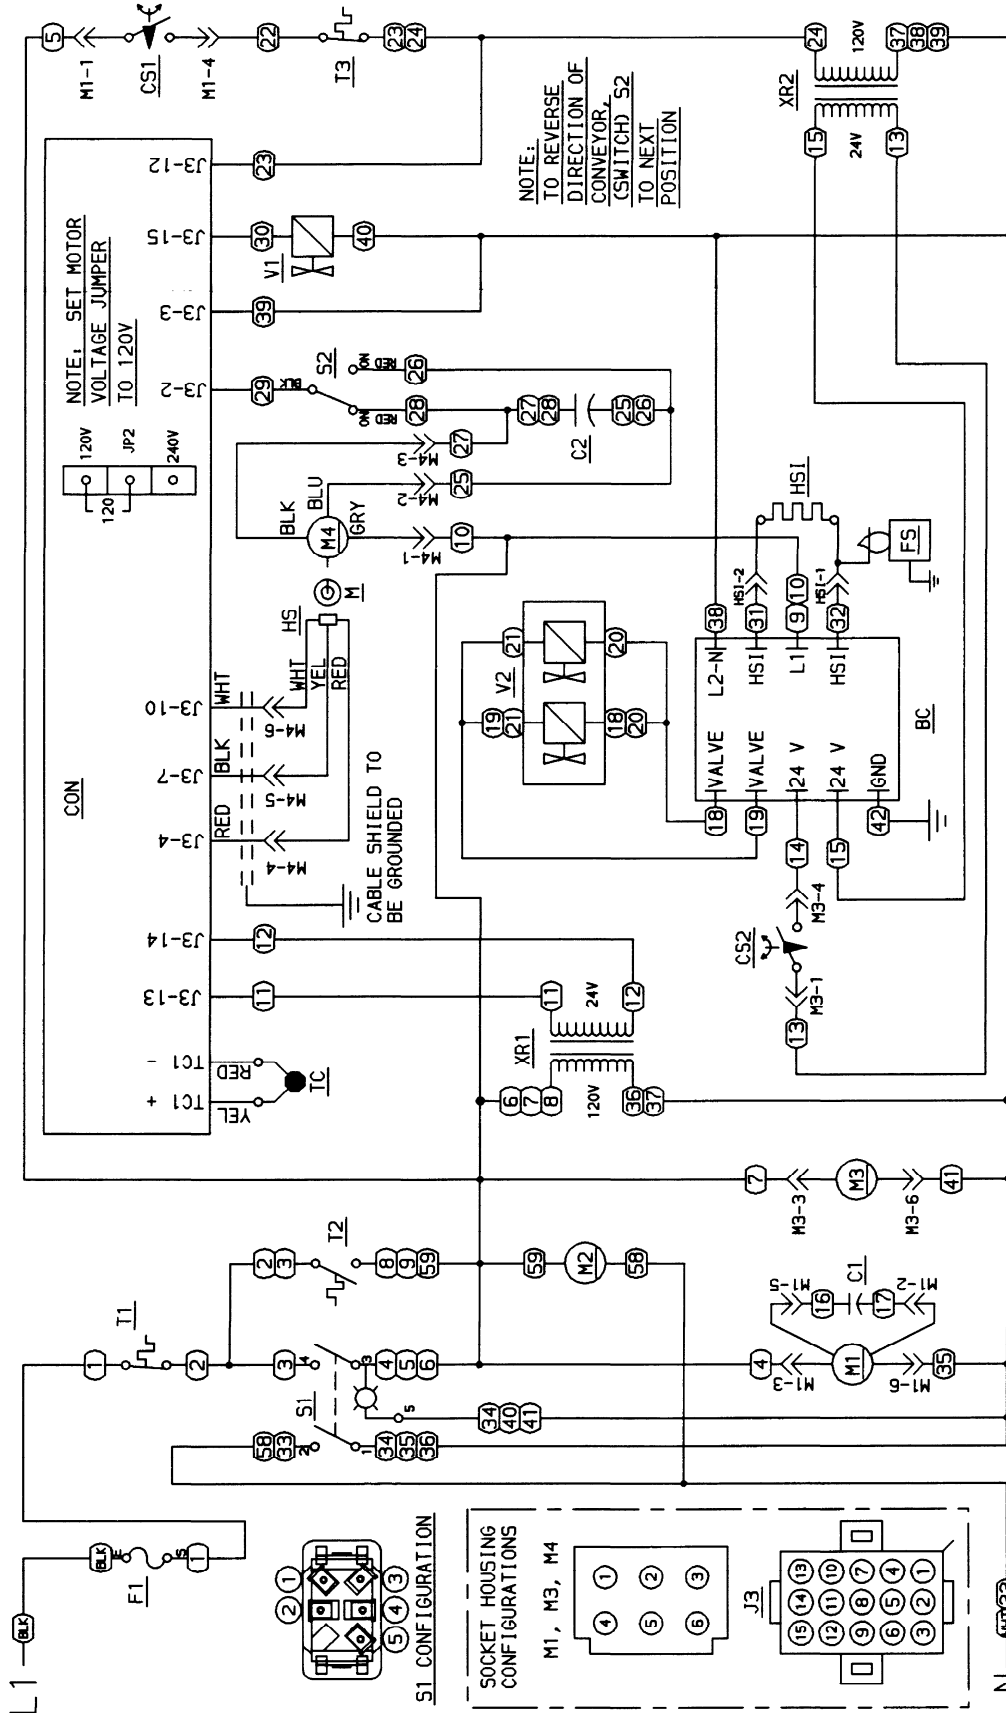

POWER SUPPLY	Electrical power is supplied to the oven by a three-conductor cordset. Voltage from the black conductor to the white conductor is 120VAC. Black conductor is hot White conductor is neutral. Green conductor is ground.
CONTROL BOX AUTO COOL DOWN	When the temperature in the control box reaches 120°F ± 3° (48.9°C ± 1.7°), the cooling fan thermostat will switch power to the control box cooling fan. The thermostat will interrupt power to the cooling fan when the control box temperature falls to 100°F ± 3° (37.8°C ± 1.7°).
MAIN FAN CIRCUIT	Power is permanently supplied, through a 10 amp fuse, and through a normally closed control box hi-limit thermostat, to the normally open main power switch. Power is also supplied to the normally open cooling fan thermostat. Closing the main power switch supplies 120VAC to the main fan motor, the cooling fan motor, the primary of the control transformer, the conveyor motor and to the ignition control.
BURNER CIRCUIT	Closing the main power switch supplies 120VAC to the burner blower motor. 120VAC is also supplied, through the normally closed oven cavity hi-limit thermostat, the main fan centrifugal switch (this switch closes when the main fan reaches approx. 1600 RPM), to the primary of the burner transformer.
IGNITION CONTROL	The ignition control operates on both 24VAC and 120VAC. When the control is energized by 24VAC from the transformer, 120VAC is switched by the ignition control to the hot surface igniter for 45 seconds for the hot surface igniter warm up. The igniter glows red, 24VAC is switched to the gas valve, which opens, and ignition should now occur.
TEMPERATURE CONTROL	Closing the main power switch supplies 120VAC to the primary of the oven control transformer. Secondary voltage, 24VAC, is supplied to the oven control. The oven control is set to desired temperature. The thermocouple will provide varying millivolts to the oven control. The oven control supplies 120VAC to the temperature regulation valve at intermittent intervals to maintain the desired temperature. The display on the oven control will indicate when the temperature regulation valve is energized. NOTE: The display also indicates oven temperature
CONVEYOR DRIVE	Closing the main power switch supplies 120VAC to the conveyor motor and to the primary of the control transformer. Secondary voltage, 24VAC, is supplied to the oven control. Setting the oven control to the desired time outputs voltage, through a reversing switch, to the conveyor motor. NOTE: The conveyor system uses a hall effect sensor and magnet to prove operation of the conveyor motor. If the conveyor motor is not running, "BELT JAM" is indicated on the display.

**SEQUENCE OF OPERATION
IMPINGER II ADVANTAGE
SERIAL NUMBER 2038616 AND ABOVE
(OVENS WITH PUSH BUTTON CONTROLS)**

1130-000-A	208VAC	60 HZ.	1	PHASE
1131-000-A	240VAC	60 HZ.	1	PHASE
1132-000-A	208VAC	60 HZ.	3	PHASE
1133-000-A	240VAC	60 HZ.	3	PHASE

POWER SUPPLY	Electrical power to be supplied to the oven by a three conductor service for single phase and a four conductor service for three phase. Black conductor is hot. Red conductor is hot. Orange conductor is hot (used for three phase only). Green conductor is ground.
CONTROL BOX AUTO COOL DOWN	When the temperature in the control box reaches $120^{\circ}\text{F} \pm 3^{\circ}$ ($48.9^{\circ}\text{C} \pm 1.7^{\circ}$), the cooling fan thermostat will switch power to the control box cooling fan. The thermostat will interrupt power to the cooling fan when the control box temperature falls to $100^{\circ}\text{F} \pm 3^{\circ}$ ($37.8^{\circ}\text{C} \pm 1.7^{\circ}$).
MAIN FAN CIRCUIT	Power is permanently supplied through the 10 amp fuses, through the normally closed control box hi-limit thermostat, to the normally open main power switch. Power is also supplied to the normally open cooling fan thermostat. Closing the main power switch supplies 208/240VAC to the main fan motor, the cooling fan motor, the primary of the control transformer, the conveyor motor and to the oven control.
TEMPERATURE CONTROL	Closing the main power switch supplies 208/240VAC to the primary of the control transformer. Secondary voltage, 24VAC, is supplied to the oven control. The oven control is set to desired temperature. The thermocouple will provide varying millivolts to the oven control. The oven control supplies 208/240VAC to the coil of the heater relay at intermittent intervals to maintain the desired temperature. The display on the oven control will indicate when the heater relay is energized. NOTE: The display also indicates oven temperature.
CONVEYOR DRIVE	Closing the main power switch supplies 208/240VAC to the conveyor motor and to the primary of the control transformer. Secondary voltage, 24VAC, is supplied to the oven control. Setting the oven control to the desired time outputs voltage, through a reversing switch, to the conveyor motor. NOTE: The conveyor system uses a hall effect sensor and magnet to prove operation of the conveyor motor. If the conveyor motor is not running, "BELT JAM" is indicated on the display.

GAS OVENS
SERIAL NUMBER 2038616 AND ABOVE
(OVENS WITH PUSH BUTTON CONTROLS)**

MODEL 1116-000-A	NAT. GAS	120VAC	60 HZ.
MODEL 1117-000-A	LP GAS	120VAC	60 HZ.

SYMPTOM POSSIBLE	CAUSE	EVALUATION
Oven fan will not run	Incoming power supply	Check circuit breakers, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.
	Fuse, 10 Amp	Check, replace if necessary.
	Fuse holder	Check, replace if necessary.
	Hi-limit thermostat, control box	Check for voltage on both sides of switch. Terminals are normally closed. If open, reset and test oven for proper operation. If thermostat will not hold, and control box temperature is not exceeding 140°F (60°C), replace thermostat.
	Switch, main power	Check continuity between switch terminals. Replace switch as needed.
	Main fan motor	Check for 120VAC at motor. If no voltage is present, trace wiring back to main power switch. WITH POWER OFF: Check for opens, shorts or grounds. Turn fan blade to check for locked rotor.
	Capacitor	Check for shorts or grounds. WARNING: Capacitor has a stored charge, discharge before testing.
No control box cooling	Incoming power	Check circuit breakers, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.
	Switch, main power	Check continuity between switch terminals. Replace switch as needed.
	Cooling fan	Check for 120VAC at cooling fan. If no voltage is present, trace wiring back to power switch. If voltage is present, and motor does not run, check for opens, shorts or grounds. WITH POWER OFF: Check for locked rotor.
No automatic control box cooling	Incoming power supply	Check circuit breakers, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.
	Cooling fan thermostat	Check the cooling fan thermostat. (Thermostat closes at 120°F and opens at 100°F). With the cooling fan thermostat pre-heated, check for continuity. If switch is open, replace cooling fan thermostat.
	Cooling fan	Check for 120VAC at cooling fan. If no voltage is present, trace wiring back to cooling fan thermostat. If voltage is present, and motor does not run, check for opens, shorts or grounds. WITH POWER OFF: Check for locked rotor.
Oven will not heat	Gas supply	Check for adequate gas supply to oven.
	Manual gas shut off valve.	Check to see that the manual gas shut off valve is open. Also check flexible gas line connection for any damage.

	Main fan	If not operating, refer to "Oven fan will not run".
	Centrifugal switch of main fan motor	Check for 120VAC at wire #5 (input to centrifugal switch, located at 6-pin connector in raceway near the main fan motor) to neutral. If no voltage is present, trace wiring back to the main power switch. If voltage is present, check for 120VAC at wire #22 (output of centrifugal switch) to neutral. If no voltage is present at #22, and the motor is running, replace the main fan motor.
	Hi-limit thermostat, oven cavity	Terminals are normally closed. If open, reset thermostat and retest. If thermostat will not hold for maximum oven temperature, and oven is not exceeding temperature setting, check for proper location of capillary bulb in its spring holder. If the capillary checks okay, replace the hi-limit thermostat.
	Burner blower motor	Check for 120VAC supplied to burner blower motor at wire #13 to neutral. If no voltage is present, trace wiring back to the main power switch. If voltage is present, and the motor is not running, check for opens, shorts or grounds. WITH POWER OFF: Turn motor to check for locked rotor.
	Burner transformer	Check for 120VAC supplied to the primary of the burner transformer. If no voltage is present, trace wiring back to the oven cavity hi-limit thermostat. If voltage is present, check for 24VAC at transformer secondary. If there is primary voltage but no secondary voltage, replace burner transformer.
	Centrifugal switch of burner blower motor	Check for 24VAC at motor connector, wire #13 to neutral. If voltage is not present, trace wiring back to transformer. If voltage is present, check for voltage at wire #14 to neutral. If no voltage is present at wire #14, and motor is running, replace burner blower motor.
	Ignition control	Check for 24VAC at ignition control terminals marked "24V", if no voltage is present, trace wiring back to centrifugal switch. Check for 120VAC to ignition control at terminal "L1" to neutral. If no voltage is present, trace wiring back to main power switch. When 24VAC is supplied to the ignition control, the ignition control switches 120VAC to the hot surface igniter. If 24VAC and 120VAC are supplied to ignition control, but there is no voltage at the hot surface igniter, replace the ignition control.
	Hot surface igniter	If 120VAC is present at hot surface igniter terminals, visually check to see that the igniter is heating (igniter may be viewed through the port in the end of burner tube). The igniter should glow bright red. If the igniter does not heat, replace the hot surface igniter.
	Ignition control	After 45 seconds of hot surface igniter pre-heat, the ignition control will switch 23VAC to the gas control valves. Check for 24VAC output from ignition control across terminals marked "valve" and "valve gnd". If no voltage is present, replace ignition control.
	Gas control valves	When 24VAC is supplied to the gas control

		valves, the valve should open. Check for gas pressure at the manifold tap located just before the burner. If there is no pressure, check the incoming gas supply to be sure all manual valves are open and flexible gas hose is properly connected. If gas is present, and the gas control valve is energized, but there is no gas pressure at the burner manifold, replace the gas control valves.
Flame will not stay lit	Hot surface igniter	Six seconds after the gas valve opens, ignition must occur. If flame is not detected, the ignition control will shut off and lock out. To reset the ignition control, turn off the power switch for 45 seconds, then turn the switch on to re-try ignition. The ignition control requires a minimum of 0.8 DC microamps to prove flame. To check flame sensing operation, connect a digital multimeter (capable of measuring DC microamps) between the "ground" terminal on ignition control and the ground lead. NOTE: This is a current measurement and the meter must be connected in series If these readings are not achieved, replace hot surface igniter. NOTE: The DC microamp test must be conducted with the oven in low flame (bypass) operation. Set the temperature control to the lowest setting.
	Power supply	If there is sufficient microamp current, but the flame will not stay lit, check for proper polarity of the 120VAC power supply.
	Ignition control	If there is sufficient microamp current, and the 120VAC polarity is correct, but the flame will not stay lit, replace the ignition control. NOTE: Check for proper ground connection on ignition control.
	NOTE: Flame should be on at this time	
Low flame is on, but no main flame	Control transformer	Check for 120VAC supply to the primary of the control transformer. If no voltage is present, trace wiring back to the main power switch. If voltage is present, check for 24VAC at the transformer secondary. If there is primary voltage, but no secondary voltage, replace the control transformer.
	Oven control	Check for 24VAC supply to control. If no voltage is present, trace wiring back to control transformer. If 24VAC is present, check for a read-out on the display. If there is 24VAC supplied, but there is no read-out on the control display, replace the oven control. If there is a read-out on the control, set the control to maximum temperature (see installation operations manual for temperature adjustment). With the control set at maximum temperature, check for 120VAC at the temperature regulation valve. If there is voltage at the temperature regulation valve, proceed to "Temperature regulation valve" for next check. If there is no voltage at the temperature regulation valve, trace wiring back to the oven control. If there is no

		voltage output at the oven control, check the read-out on the control. If the control reads "PROBE FAIL", this indicates that the thermocouple has failed or become disconnected from the oven control.
	Thermocouple	Check to be sure that the thermocouple is securely connected to the oven control. If the thermocouple is connected to the oven control, and the control indicates "PROBE FAIL", disconnect the thermocouple from the oven control and measure the resistance of the thermocouple. The thermocouple should read approx. 11Ω. If these readings are not achieved, replace the thermocouple. If these readings are correct, proceed.
	Oven control	If the thermocouple checks good, but the oven control display indicates that there is a thermocouple failure, replace the oven control. If the oven control indicates a temperature reading but the oven will not heat, proceed.
	Thermocouple	WITH POWER ON AND THERMOCOUPLE ATTACHED TO THE OVEN CONTROL: Measure the DC millivolt output of the thermocouple. Refer to the thermocouple chart (located in the "Removal" section of the manual) for proper millivolt readings. If these readings are not achieved, replace thermocouple.
	Oven control	If the thermocouple checks good, but there is no 120VAC output to the temperature regulation valve, replace the oven control. If there is 120VAC output to the temperature regulation valve, proceed.
	Temperature regulation valve	Check for 120VAC supplied to temperature regulation valve. If voltage is present, listen for valve to open and close. Also check for opens or shorts in the operating coil. Replace temperature regulation valve as needed.
Intermittent heating	Thermal/overload of main fan and burner blower motors	The main fan motor and burner blower motor are equipped with internal thermal protection and will cease to operate if overheating occurs. As the motors overheat and then cool, this will cause the heating system to cycle on and off intermittently. Improper ventilation or lack of preventive maintenance may cause this problem. Also, most of the problems listed under "Oven will not heat" can cause intermittent failure.
Conveyor will not run	Power supply	Check for incoming voltage at line 1 to neutral. There should be a reading of 120VAC. If not present, check circuit breakers.
	Fuse, 10 Amp	Check, replace if necessary.
	Fuse holder	Check, replace if necessary.
	Hi-limit thermostat, control box	Check for voltage on both sides of switch. Terminals are normally closed. If open, reset and test oven for proper operation. If thermostat will not hold, and control box temperature is not exceeding 140°F (60°C), replace thermostat.
	Power switch	Check continuity between switch terminals. Replace switch as needed.
	Control transformer	Check for 120 VAC supply to the primary of the control transformer. If no voltage is present, trace

		wiring back to the oven power relay. If voltage is present, check for 24 VAC at the transformer secondary. If there is primary voltage but no secondary voltage, replace control transformer.
	Conveyor motor	Check for 120 VAC supply to the conveyor motor at wire #14 to neutral. If no voltage is present, trace wiring back to the primary of the control transformer. If voltage is present and the motor will not run, check the motor windings for opens or shorts. WITH POWER OFF: Check the motor windings as follows: Grey to black - 38Ω approx. Grey to blue - 38Ω approx. Blue to black - 75Ω approx. If any of the above fails, replace conveyor motor.
	Capacitor, conveyor motor	Check for shorts or grounds. Replace capacitor as needed. WARNING: Capacitor has a stored charge, discharge before testing.
	Switch, conveyor reversing	Check continuity between switch terminals. Replace switch as needed.
	Oven control	If there is 120VAC supplied to the motor, and the motor, capacitor, and reversing switch check good, replace the oven control.
Conveyor motor runs, but there is no speed display	NOTE: Display will indicate "Belt Jam"	
	Oven control	Check for output voltage from oven control to hall effect sensor (sensor is located in conveyor motor). Measure voltage at the motor connector, red wire and yellow wire. Voltage should be approx. 10VDC. If no voltage is present, trace wiring back to oven control. If there is no voltage present at the oven control, replace the oven control.
	Conveyor motor	If there is voltage supplied to the hall effect sensor, check for a frequency output from the hall effect sensor. Measure frequency across the yellow and white wires at the motor connector. Frequency reading should be approx. 25 – 100 Hz. If these readings are not achieved, replace conveyor motor. If the readings are achieved, proceed.
	Oven control	If the hall effect sensor readings are correct, but there is no speed indicated on the display, replace the oven control.

TROUBLESHOOTING GUIDE ELECTRIC OVENS

1130-000-A	208VAC	60 HZ.	1	PHASE
1131-000-A	240VAC	60 HZ.	1	PHASE
1132-000-A	208VAC	60 HZ.	3	PHASE
1133-000-A	240VAC	60 HZ.	3	PHASE

SYMPTOM POSSIBLE	CAUSE	EVALUATION
Oven fan will not run	Incoming power supply	Check circuit breakers. Reset if required. Call power co. if needed.
	Fuses, 10 Amp, motor and controls	Check, replace if necessary.
	Fuse holder	Check, replace if necessary.
	Hi-limit thermostat, control box	Check for voltage on both sides of switch. Terminals are normally closed. If open, reset and test oven for proper operation. If thermostat will not hold, and control box temperature is not exceeding 140°F (60°C), replace thermostat.
	Switch, main power	Check continuity between switch terminals. Replace switch as needed.
	Main fan motor	Check for supply voltage at motor. If no voltage is present, trace wiring back to main power switch. WITH POWER OFF: Check for opens, shorts or grounds. Turn fan blade to check for locked rotor.
	Capacitor	Check for shorts or grounds. WARNING: Capacitor has a stored charge, discharge before testing.
No control box cooling	Incoming power	Check circuit breakers, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.
	Switch, main power	Check continuity between switch terminals. Replace switch as needed.
	Cooling fan	Check for supply voltage at cooling fan. If no voltage is present, trace wiring back to power switch. If voltage is present, and motor does not run, check for opens, shorts or grounds. WITH POWER OFF: Check for locked rotor.
No automatic control box cooling	Incoming power supply	Check circuit breakers, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.
	Cooling fan thermostat	Check the cooling fan thermostat. (Thermostat closes at 120°F and opens at 100°F). With the cooling fan thermostat pre-heated, check for continuity. If switch is open, replace cooling fan thermostat.
	Cooling fan	Check for supply voltage at cooling fan. If no voltage is present, trace wiring back to cooling fan thermostat. If voltage is present, and motor does not run, check for opens, shorts or grounds. WITH POWER OFF: Check for locked rotor.
Oven will not heat	Main fan motor	Check for main fan operation. If it is not operating, refer to "Oven fan will not run".
	Air pressure switch	This normally open switch should close when the main fan is activated. Refer to the "Removal and installation" section for proper adjustment. Replace as needed.
	Hi-limit thermostat,	Terminals are normally closed. If open, reset

	oven cavity	thermostat and retest. If thermostat will not hold for maximum oven temperature, and oven is not exceeding temperature setting, check for proper location of capillary bulb in its spring holder. If the capillary checks okay, replace the hi-limit thermostat.
	Control transformer	Check for 120VAC supply to the primary of the control transformer. If no voltage is present, trace wiring back to the main power switch. If voltage is present, check for 24VAC at the transformer secondary. If there is primary voltage, but no secondary voltage, replace the control transformer.
	Oven control	Check for 24VAC supply to control. If no voltage is present, trace wiring back to control transformer. If 24VAC is present, check for a read-out on the display. If there is 24VAC supplied, but there is no read-out on the control display, replace the oven control. If there is a read-out on the control, set the control to maximum temperature (see installation operations manual for temperature adjustment). With the control set at maximum temperature, check for supply voltage at mercury contactor. If there is voltage at the mercury contactor, proceed to "mercury contactor" for next check. If there is no voltage at the mercury contactor, trace wiring back to the oven control. If there is no voltage output at the oven control, check the read-out on the control. If the control reads "PROBE FAIL", this indicates that the thermocouple has failed or become disconnected from the oven control.
	Thermocouple	Check to be sure that the thermocouple is securely connected to the oven control. If the thermocouple is connected to the oven control, and the control indicates "PROBE FAIL", disconnect the thermocouple from the oven control and measure the resistance of the thermocouple. The thermocouple should read approx. 11Ω. If these readings are not achieved, replace the thermocouple. If these readings are correct, proceed.
	Oven control	If the thermocouple checks good, but the oven control display indicates that there is a thermocouple failure, replace the oven control. If the oven control indicates a temperature reading but the oven will not heat, proceed.
	Thermocouple	WITH POWER ON AND THERMOCOUPLE ATTACHED TO THE OVEN CONTROL: Measure the DC millivolt output of the thermocouple. Refer to the thermocouple chart (located in the "Removal" section of the manual) for proper millivolt readings. If these readings are not achieved, replace thermocouple.
	Oven control	If the thermocouple checks good, but there is no voltage output to the mercury contactor, replace the oven control. If there is voltage output to the mercury contactor, proceed.
	Mercury contactor	Check for supply voltage to the contactor coil. If voltage is present and the contactor will not

		activate, replace the mercury contactor. Also check each contactor for high voltage input and output.
	Heating element(s)	Check the Amp draw on each power leg for proper load. Check the specification plate for rating information. If the amp draw is high or low, check the individual elements for opens, shorts and proper resistance. WITH POWER OFF: To check resistance of the elements, remove all leads from the elements and use a digital multimeter. The element resistance is should be as follows: 208V – 27 ohms 240V – 36 ohms Replace heating elements as needed.
Oven heats with switch off	Mercury contactor	The mercury contactor has probably failed in the closed position. If there is no voltage to the operating coil, but there is high voltage at the contactor output, replace the mercury contactor.
Intermittent heating	Thermal/overload of motor	The main fan motor is equipped with internal thermal protection and will cease to operate if overheating occurs. As the motor overheats and then cools, this will cause the oven to cycle on and off intermittently. Improper ventilation or lack of preventive maintenance may cause this. Also, most of the problems listed under “Oven will not heat” can cause intermittent failure.
Conveyor will not run	Power supply	Check circuit breakers, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.
	Fuse, 10 Amp	Check, replace if necessary.
	Fuse holder	Check, replace if necessary.
	Hi-limit thermostat, control box	Check for voltage on both sides of switch. Terminals are normally closed. If open, reset and test oven for proper operation. If thermostat will not hold, and control box temperature is not exceeding 140°F (60°C), replace thermostat.
	Power switch	Check continuity between switch terminals. Replace switch as needed.
	Control transformer	Check for supply voltage to the primary of the control transformer. If no voltage is present, trace wiring back to the oven power relay. If voltage is present, check for 24 VAC at the transformer secondary. If there is primary voltage but no secondary voltage, replace control transformer.
	Conveyor motor	Check for supply voltage to the conveyor motor. If no voltage is present, trace wiring back to the primary of the control transformer. If voltage is present and the motor will not run, check the motor windings for opens or shorts. WITH POWER OFF: Check the motor windings as follows: Grey to black - 240Ω approx. Grey to tan - 240Ω approx. Tan to black - 480Ω approx. If any of the above fails, replace conveyor motor.
	Capacitor, conveyor motor	Check for shorts or grounds. Replace capacitor as needed. WARNING: Capacitor has a stored charge,

		discharge before testing.
	Switch, conveyor reversing	Check continuity between switch terminals. Replace switch as needed.
	Oven control	If there is supply voltage to the motor, and the motor, capacitor, and reversing switch check good, replace the oven control.
Conveyor motor runs, but there is no speed display	NOTE: Display will indicate "Belt Jam"	
	Oven control	Check for output voltage from oven control to hall effect sensor (sensor is located in conveyor motor). Measure voltage at the motor connector, red wire and yellow wire. Voltage should be approx. 10VDC. If no voltage is present, trace wiring back to oven control. If there is no voltage present at the oven control, replace the oven control.
	Conveyor motor	If there is voltage supplied to the hall effect sensor, check for a frequency output from the hall effect sensor. Measure frequency across the yellow and white wires at the motor connector. Frequency reading should be approx. 25 – 100 Hz. If these readings are not achieved, replace conveyor motor. If the readings are achieved, proceed.
	Oven control	If the hall effect sensor readings are correct, but there is no speed indicated on the display, replace the oven control.

REMOVAL, INSTALLATION AND ADJUSTMENTS

IMPINGER II ADVANTAGE SERIES

CAUTION

BEFORE REMOVING OR INSTALLING ANY COMPONENT IN THE IMPINGER OVEN BE SURE TO DISCONNECT ELECTRICAL POWER AND GAS SUPPLY.

MAIN FAN – REPLACEMENT

- A. Shut off power at main breaker.
 - B. Remove motor cover from back of oven.
 - C. Disconnect wiring and mark for reassembly.
 - D. Remove bolts and slide back straight out of the oven.
 - E. Loosen the bolt from fan hub and remove fan from motor shaft.
- NOTE: Measure distance from fan blade to rear wall assembly before removal to aid in reassembly.
- F. Reassemble in reverse order and check system operation.

MOTOR, MAIN FAN – REPLACEMENT

- A. Shut off power at main breaker.
 - B. Remove motor cover from back of oven.
 - C. Disconnect wiring and mark for reassembly.
 - D. Remove bolts and slide back straight out of the oven.
 - E. Loosen the bolt from fan hub and remove fan from motor shaft.
- NOTE: Measure distance from the fan blade to rear wall assembly before removal to aid in reassembly.
- F. Remove four screws from motor support assembly.
 - G. Remove motor mount clamp and remove motor from oven back.
 - H. Remove motor mount from motor.
 - I. Reassemble in reverse order and check system operation.

CAPACITOR – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control box cover and front panel.
- C. Discharge capacitor.
- D. Remove capacitor.
- E. Reassemble in reverse order and check system operation.

ON/OFF SWITCH – REPLACEMENT

- A. Shut off power at main breaker.
 - B. Remove control box cover and front panel.
 - C. Depress spring clips on sides of switch and push out.
 - D. Remove wires from switch and mark for reassembly.
 - E. Reassemble in reverse order and check system operation.
- NOTE: Make sure switch housing is fully seated in control box housing.

FUSE HOLDER – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control box cover and front panel.
- C. Remove wires from fuse holder and mark for reassembly.
- D. Remove mounting screws or mounting nut on fuse holder and remove fuse holder.
- E. Reassemble in reverse order and check system operation.

THERMOSTAT, CONTROL BOX HI-LIMIT – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control box cover and front panel.
- C. Remove wires from thermostat and mark for reassembly.
- D. Remove mounting screws and remove thermostat.
- E. Reassemble in reverse order and check system operation.

NOTE: Push reset button on new thermostat.

COOLING FAN, CONTROL BOX – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Remove four mounting screws from fan frame.
- D. Disconnect power cord and remove fan.
- E. Reassemble in reverse order and check system operation.

THERMOSTAT, COOLING FAN, REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Remove wires and mark for reassembly.
- D. Remove two mounting screws and remove thermostat.
- E. Reassemble in reverse order and check system operation.

NOTE: Push reset button on new thermostat.

BURNER BLOWER MOTOR – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Unplug motor connector.
- D. Remove three mounting screws from blower tube at burner housing.
- E. Remove air shutter assembly from old motor for assembly on new motor.
- F. Reassemble in reverse order and check system operation.

NOTE: Check air shutter at approximately $\frac{1}{2}$ open and adjust to get a blue flame with an occasional tip of yellow under high flame. A view port in the burner assembly should be used to observe flame.

HI-LIMIT THERMOSTAT, OVEN CAVITY – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove conveyor and bottom finger assembly.
- C. Remove capillary bulb from bracket in oven chamber and pull capillary tube through tube into control box.
- D. Remove all wires and mark for reassembly.
- E. Remove mounting nut and remove thermostat.
- F. Reassemble in reverse order and check system operation. Be sure capillary tube is securely in the mount.

NOTE: Push reset button on new thermostat.

TRANSFORMER, BURNER – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Remove all wires from transformer and mark for reassembly.
- D. Remove two mounting screws from transformer base and remove transformer.
- E. Reassemble in reverse order and check system operation.

OVEN CONTROL – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control box cover and front panel.
- C. Remove all wiring connections and mark for reassembly.
- D. Remove oven control by pulling control from the mounting pins. Remove control from oven.
- E. Before installing new oven control, set voltage jumper (located at the bottom center of the oven control) to the proper voltage (120V/240V) position. Install the four pushbutton extensions (included with the oven control) by pushing the extensions onto the four set buttons on control.
- F. Reassemble in reverse order and check system operation.
- G. Set the oven control for the proper operating mode. The 1100 series ovens use a single temperature control system. The oven control must be set to the proper operating mode. Set the control as follows: With the oven power switch “off”, depress the “time” and “up” buttons and turn the oven “on”. Control will indicate “Imp I or Imp II” Release the buttons, The control will indicate “Temp to store”. Press the “up” or “down” button until “Imp II” appears on the display. Press the “temp” button. The control is now set for single burner operation.

TRANSFORMER – CONTROL – REPLACEMENT

See *“TRANSFORMER –BURNER - REPLACEMENT*

THERMOCOUPLE – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove conveyor and bottom finger assembly.
- C. Remove control panel top and front cover.
- D. Remove thermocouple from bracket in oven chamber and pull thermocouple through tube into control box.
- E. Remove two thermocouple wires from temperature control. Note wire color and location for reassembly
- F. Reassemble in reverse order and check system operation

THERMOCOUPLE MEASUREMENT

TEMPERATURE (°F)	D.C.	MILLIVOLTS
200	°	2.8
250	°	4.0
300	°	5.1
	350°	6.0
400	°	7.1
450	°	8.2
500	°	9.3
550	°	10.4
600	°	11.5

BURNER CONTROL – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Remove wires from control and mark for reassembly.
- D. Remove mounting screws from control and remove burner control.
- E. Reassemble in reverse order and check system operation.

GAS VALVE – REPLACEMENT

- A. Shut off power at main breaker.
- B. Shut off gas supply to the oven and disconnect the flexible gas line to oven.
- C. Remove control panel top and front cover.
- D. Remove the manual gas shut-off valve.
- E. Remove screws from the bulkhead plate on inlet gas pipe and remove inlet gas pipe.
- F. Remove pilot tube and wiring from gas valve, Mark all wiring for reassembly.
- G. Disconnect pipe union in gas line and remove gas valve and piping assembly.
- H. Remove piping from gas valve.
- I. Reassemble in reverse order and check system operation.
- J. Check all gas line fitting for leaks.
- K. Adjust the gas manifold pressure on the gas valve. Refer to the specification plate on the oven for proper rating.

TEMPERATURE REGULATION VALVE – REPLACEMENT

- A. Shut off power at main breaker.
- B. Shut off gas supply to the oven and disconnect the flexible gas line to oven.
- C. Remove control panel top and front cover.
- D. Remove bypass tube from burner manifold.
- E. Remove wiring from valve and mark for reassembly.
- F. Remove four mounting nuts from burner manifold and disconnect pipe union.
- G. Remove temperature regulation valve and piping from oven.

HOT SURFACE IGNITER – REPLACEMENT

- A. Shut off power at main breaker.
- B. Shut off gas supply to the oven and disconnect the flexible gas line to oven.
- C. Remove control panel top and front cover.
- D. Remove temperature regulation valve. See “TEMPERATURE REGULATION VALVE”.
- E. Disconnect wires from burner control.
- F. Remove three mounting screws and remove burner venturi.
- G. Remove mounting nut and remove hot surface igniter assembly.
- H. Reassemble in reverse order and check system operation.
- I. Check all gas line fittings for leaks.

BYPASS ORIFICE – REPLACEMENT

- A. Shut off power at main breaker.
- B. Shut off gas supply to the oven and disconnect the flexible gas line to oven.
- C. Remove control panel top and front cover.
- D. Disconnect bypass tube from gas valve.
- E. Remove bypass orifice from gas valve.
- F. Reassemble in reverse order and check system operation.
- G. Check all gas line fittings for leaks.

MAIN BURNER ORIFICE – REPLACEMENT

- A. Shut off power at main breaker.
- B. Shut off gas supply to the oven and disconnect the flexible gas line to oven.
- C. Remove control panel top and front cover.
- D. Remove burner manifold. See “TEMPERATURE REGULATION VALVE”.
- E. Remove main burner orifice from burner manifold.
- F. Reassemble in reverse order and check system operation.
- G. Check all gas line fittings for leaks.

REVERSING SWITCH – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Remove wires from reversing switch and mark for reassembly.
- D. Remove mounting nut and remove switch.
- E. Reassemble in reverse order and check system operation.

CONVEYOR DRIVE MOTOR – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Disconnect all wiring from motor and mark for reassembly.
- D. Remove coupling from motor drive shaft.
- E. Remove four screws and remove conveyor motor and mounting bracket.
- F. Remove mounting bracket from conveyor motor.
- G. Reassemble in reverse order and check system operation.

REVERSING CONVEYOR DIRECTION

- A. Shut off power at oven switch.
- B. Set conveyor reversing switch in the other position.
- C. Turn oven “on” and check for proper operation.

CAPACITOR, CONVEYOR DRIVE MOTOR – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Discharge capacitor before removing wires. Mark wires for reassembly.
- D. Remove mounting screw and remove capacitor.
- E. Reassemble in reverse order and check system operation.

AIR PRESSURE SWITCH – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Disconnect wiring from air pressure switch and mark for reassembly.
- D. Disconnect air tube from air pressure switch.
- E. Remove two mounting screws and remove air pressure switch.
- F. Reassemble in reverse order and check system operation. Be sure to calibrate new air pressure switch. For proper calibration, see below.
- G. Turn adjusting screw on air pressure switch fully counter clockwise.
- H. Turn oven “on”.
- I. Turn adjusting screw on air pressure switch clockwise until heat shuts off.
- J. Turn adjusting screw on air pressure switch counter clockwise ¼ turn.
- K. Reassemble control panel top and front cover.

BEARING, CONVEYOR – REPLACEMENT

- A. Remove conveyor from oven and place on a flat work surface.
- B. Remove connecting links from conveyor belt. See Installation Operations manual for proper procedure. Remove conveyor belt from conveyor.
- C. Move drive shaft or idler shaft toward end of conveyor, and shaft with bearing will now slip out of conveyor frame.
- D. Remove bearing from conveyor shaft.
- E. Reassemble in reverse order and check system operation.

MERCURY CONTACTOR – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove control panel top and front cover.
- C. Disconnect all wires and mark for reassembly.
- D. Remove screws from mounting bracket and remove contactor.
- E. Reassemble in reverse order and check system operation.

HEATING ELEMENT – REPLACEMENT

- A. Shut off power at main breaker.
- B. Remove back cover.
- C. Disconnect heating element wires and mark for reassembly.
- D. Disconnect motor wiring and mark for reassembly.
- E. Remove oven back from oven.
- F. Remove fan shroud.
- G. Heating element may now be unbolted and removed.
- H. Check new heating element for proper voltage. Reassemble in reverse order and check for proper operation.

**IMPINGER II ADVANTAGE
GENERAL VIEW**

LETTER PART	NUMBER	DESCRIPTION
A	369390	Caster 4" w/mounting plate
B	369502	Bottom finger cover
C		Columnating plate, see Installation & Operations manual
D	370010	Bottom finger housing
E	369504	Top finger housing
F		Columnating plate, see Installation & Operations manual
G	3695032	Top finger cover
H	369511	Oven top
I	369659	Conveyor hole cover (S/N 2052462 & Below)
	370679	Conveyor hole cover (S/N 2052463 & Above)
J	371066	Baffle
K	369211	Thumb screw
L	370118	Cross support
M	369231	Caster 4" w/threaded stem
N	369232	Adjustable leg
O 3690	19	Stand side
P	370066	Plug

CONTROL BOX
MODEL 1116-000-A, 1117-000-A
SERIAL NUMBER 2038616 AND ABOVE
(OVENS WITH PUSH BUTTON CONTROLS)

LETTER PART	NUMBER	DESCRIPTION
A	369124	Cooling fan
B	369537	Power cord
C	370362	Thermocouple type "K"
D	370378	Conveyor Motor (S/N 2052462 & Below)
	370675	Conveyor Motor (S/N 2052463 & Above)
E	370377	Motor Mount Plate (S/N 2052462 & Below)
	7008696	Motor Mount Plate (S/N 2052463 & Above)
F	369566	Main burner orifice, Nat.
	369524	Main burner orifice, LP
G	369568	Venturi, Nat. gas
	369938	Venturi, LP gas
H	369552	Hot surface igniter
J	369366	Burner blower motor
K	369401	Air shutter assy.
