MODEL 1450 120VAC 60 HZ. NAT. GAS MODEL 1451 120VAC 60 HZ. LP GAS

| Electrical power is supplied to the oven by a three conductor cordset. Voltage from the black conductor to the white conductor is reounductor is conductor is neutral. The green conductor is ground.  When the temperature in the control box reaches 120°F±3° (48.9°C±1.7°C), the cooling fan thermostat will switch power to the control box cooling fan. The thermostat will interrupt power to the cooling fan when the control box temperature falls to 100°F±3° (37.0°C±1.7°C).  MAIN FAN CIRCUIT  Electrical power is permanently supplied, through a 10 Amp fuse, to the normally open control box cooling fan thermostat. Closing the oven power switch. Power is also supplied to the normally open control box cooling fan thermostat. Closing the oven power switch supplies 120VAC to the main fan motor and to the control box cooling fan. Closing the oven power switch also supplies 120VAC to the burner blower motor, the primary of the oven control transformer and to the centrifugal switch of the main fan motor.  BURNER CIRCUIT  Closing the oven power switch supplies 120VAC to the burner blower motor and to the normally open centrifugal switch of the main fan motor. As the main fan motor reaches approx.900 RPM, the centrifugal switch closes supplying 120VAC to the oven control and to the primary of the burner transformer. The transformer secondary supplies 24VAC, through the centrifugal switch of the burner blower motor, to the ignition control.  When the ignition control is supplied with 24VAC, the pilot valve and spark igniter are energized. Ignition should now occur. After the pilot flame is proven, the main valve is energized.  Closing the oven fan switch supplies 120VAC to the primary of the control transformer and, through the centrifugal switch of the main fan motor, to the oven control. Secondary voltage, 24VAC, is supplied to the oven control. The oven control will indicate when the temperature regulation valve is energized.  CONVEYOR DRIVE  Closing the oven power switch supplies 120VAC to the conveyor motor and to the primary |                     |  |

CONVEYOR DRIVE  Closing the oven power switch supplies 120VAC to the conveyor motor and to the primary of the control transformer. Secondary voltage, 24VAC, is supplied to the oven control. Setting the oven control to the desired time outputs voltage, through a reversing switch, to the conveyor motor.  NOTE: The conveyor system uses a hall effect sensor and magnet to prove operation of the conveyor motor. If the conveyor motor is not running, "BELT  | BOTTILLE            |  |
| 120VAC to the oven control and to the primary of the burner transformer. The transformer secondary supplies 24VAC, through the centrifugal switch of the burner blower motor, to the ignition control.  IGNITION CONTROL  When the ignition control is supplied with 24VAC, the pilot valve and spark igniter are energized. Ignition should now occur. After the pilot flame is proven, the main valve is energized.  Closing the oven fan switch supplies 120VAC to the primary of the control transformer and, through the centrifugal switch of the main fan motor, to the oven control. Secondary voltage, 24VAC, is supplied to the oven control. The oven control is set to desired temperature. The thermocouple will provide varying millivolts to the oven control. The oven control supplies 120VAC to the temperature regulation valve at intermittent intervals to maintain the desired temperature. The display on the oven control will indicate when the temperature regulation valve is energized.  NOTE: The display also indicates oven temperature.  CONVEYOR DRIVE  Closing the oven power switch supplies 120VAC to the conveyor motor and to the primary of the control transformer. Secondary voltage, 24VAC, is supplied to the oven control. Setting the oven control to the desired time outputs voltage, through a reversing switch, to the conveyor motor. |                        | Burner blower motor            | Check for 120VAC supplied to burner blower motor. If        |
|                        |                                | no voltage is present, trace wiring back to primary of      |
|                        |                                | control transformer. If voltage is present and motor is     |

| Burner transformer  Centrifugal switch of burner blower motor | not running, check for opens, shorts or grounds. WITH POWER OFF: Turn motor to check for locked rotor. Replace burner blower motor as needed. Check for 120VAC supplied to primary of burner transformer. If no voltage is present, trace wiring back to centrifugal switch of main fan motor. If voltage is present, check for 24VAC supply at transformer secondary. If there is primary voltage but no secondary voltage, replace burner transformer. Check for 24VAC at motor connector, wire #19 (input to centrifugal switch) to neutral. If no voltage is present, trace wiring back to burner transformer. If voltage is present, check for 24VAC at wire #20 (output of centrifugal switch) to neutral. If no voltage is present at wire #20 and motor is running, replace burner blower |
|---|---|
| Centrifugal switch of burner                                  | Check for 120VAC supplied to primary of burner transformer. If no voltage is present, trace wiring back to centrifugal switch of main fan motor. If voltage is present, check for 24VAC supply at transformer secondary. If there is primary voltage but no secondary voltage, replace burner transformer.  Check for 24VAC at motor connector, wire #19 (input to centrifugal switch) to neutral. If no voltage is present, trace wiring back to burner transformer. If voltage is present, check for 24VAC at wire #20 (output of centrifugal switch) to neutral. If no voltage is present at   |
|   | present, check for 24VAC supply at transformer secondary. If there is primary voltage but no secondary voltage, replace burner transformer.  Check for 24VAC at motor connector, wire #19 (input to centrifugal switch) to neutral. If no voltage is present, trace wiring back to burner transformer. If voltage is present, check for 24VAC at wire #20 (output of centrifugal switch) to neutral. If no voltage is present at  |
|   | Check for 24VAC at motor connector, wire #19 (input to centrifugal switch) to neutral. If no voltage is present, trace wiring back to burner transformer. If voltage is present, check for 24VAC at wire #20 (output of centrifugal switch) to neutral. If no voltage is present at   |
|   | centrifugal switch) to neutral. If no voltage is present, trace wiring back to burner transformer. If voltage is present, check for 24VAC at wire #20 (output of centrifugal switch) to neutral. If no voltage is present at  |
|   | motor.  |
| Ignition control  | Check for 24VAC supply to the ignition control. If no voltage is present, trace wiring back to centrifugal switch of burner blower motor. If voltage is present, check for 24VAC at pin #3 and ground (pilot valve). NOTE: The Honeywell ignition control has a 30 second pre-purge (time delay) built in. If voltage is not present, replace ignition control. If the pilot valve is energized, check to see that the high voltage igniter circuit is also energized. To check, disconnect the igniter lead from the ignition control.   |
| No pilot flame  | If the ignition control is supplied with 24Vac and the pilot valve (internal to valve assembly) and igniter circuits are energized, visually check for pilot flame. This may be done by opening the small inspection door on the end of the burner, or by opening the main oven door and looking under the lower finger housings on the right side of the oven. If no pilot flame is visible,   |
| Pilot shut-off valve  | check the pilot shut-off valve.  Check to see that the pilot shut-off valve is open (shut-off valve is located between valve assembly and burner).  |
| Pilot tube  | Check for gas pressure at the pilot tube. Disconnect pilot tube at burner and connect a manometer to pilot tube. If no gas pressure is present during ignition, check for blockage in pilot tube or pilot shut-off valve. If these are clear, and there is gas supplied to the oven, replace the gas valve.   |
| Pilot orifice   | If there is gas pressure at the pilot tube, check the pilot orifice for obstructions. Replace as needed.  |
| Burner igniter  | Check the burner igniter head for any obstructions, also check for frayed or broken wire. Check spark gap (gap should be .100 to .125 inch). If there is visible damage, replace burner igniter.  |
| NOTE: Flame should be on at this time                         |   |
| Pilot flame, but no main flame  Control transformer           | Check for 120VAC supply to the primary of the control transformer. If no voltage is present, trace wiring back to the oven power switch. If voltage is present, check foe 24VAC at the transformer secondary. If there is primary voltage, but no secondary voltage, replace control transformer.   |
| Oven control  | Check for 24VAC supply to oven control. If no voltage is present, trace wiring back to control transformer. If 24VAC is present, check for a read-out on the display. If there is 24VAC supplied, but there is no read-out on uniquer L = 1450 Series Gas Service Manual - Domestic   |

|                       |   | the display, replace oven control. If there is a read-out on the control, set the control to maximum temperature (see Installation operations manual for temperature adjustment). With the control set at maximum temperature, check for 120VAC at the temperature regulation valve. If there is voltage at the temperature regulation valve, proceed to "Temperature regulation valve" for next check. If there is no voltage at the temperature regulation valve, trace wiring back to the oven control. If there is no voltage output at the oven control, check the read-out on the oven control. If the control reads "PROBE FAIL", this indicates that the thermocouple has failed or become disconnected from the oven control. |
|-----------------------|---|--|
|                       | Thermocouple  | Check to be sure that the thermocouple is securely connected to the oven control. If the thermocouple is connected to the oven control, and the control indicates "PROBE FAIL", disconnect the thermocouple from the oven control and measure the resistance of the thermocouple. The thermocouple should read approx. 11Ω. If these readings are not achieved, replace the thermocouple. If these readings are correct, proceed.  |
|                       | Oven control  | If the thermocouple checks good, but the oven control display indicates that there is a thermocouple failure, replace the oven control. If the oven control indicates a temperature reading, but the oven will not heat, proceed.  |
|                       | Thermocouple  | WITH POWER ON AND THERMOCOUPLE ATTACHED TO THE OVEN CONTROL: Measure the DC millivolt output of the thermocouple. Refer to the thermocouple chart (located in the "Removal" section of the manual) for proper millivolt readings. If these readings are not achieved, replace thermocouple.  |
|                       | Oven control  | If the thermocouple checks good, but there is no 120VAC output to the temperature regulation valve, replace the oven control. If there is 120VAC output to the temperature regulation valve, proceed.  |
|                       | Temperature regulation valve                          | Check for 120VAC supplied to the temperature regulation valve. If voltage is present, listen for valve to open and close. Also check for opens or shorts in the operating coil. Replace temperature regulation valve as needed.  |
| Intermittent heating  | Thermal/overload of main fan and burner blower motors | The main fan motor and burner blower motor are equipped with internal thermal protection and will cease to operate if overheating occurs. As the motors overheat and then cool, this will cause the heating system to cycle on and off intermittently. Improper ventilation or lack of preventive maintenance may cause this problem. Also, most of the problems listed under "Oven will not heat" can cause intermittent failure.   |
| Conveyor will not run | Incoming power supply                                 | Check circuit breaker, reset if required. Check power plug to be sure it is firmly in receptacle. Measure incoming power, call power co. if needed.  |
|                       | Fuse, 10 Amp  | Check, replace if necessary.   |
|                       | Fuse holder Switch, oven power                        | Check, replace if necessary.  Check for 120VAC supply to switch. If no voltage is present, trace wiring back to fuse holder. Check continuity between switch terminals. Replace switch as needed.  |

|  | Control transformer                       | Check for 120VAC supply to the primary of the control transformer. If no voltage is present, trace wiring back to the oven power switch. If voltage is present, check foe 24VAC at the transformer secondary. If there is primary voltage, but no secondary voltage, replace control transformer.  |
|--|---|--|
|  | Conveyor motor                            | Check for 120VAC supply to conveyor motor at wire #6 to neutral. If no voltage is present, trace wiring back to oven power switch. If voltage is present and motor will not run, check the motor windings for opens or shorts. WITH POWER OFF: Check the motor windings as follows: Grey to black - $38\Omega$ approx. Grey to blue - $38\Omega$ approx. Blue to black - $75\Omega$ approx. If any of the above fails, replace conveyor motor. |
|  | Capacitor, conveyor motor                 | Check for shorts or grounds. Replace capacitor as needed. WARNING: Capacitor has a stored charge, discharge before testing.  |
|  | Switch, conveyor reversing                | Check continuity between switch terminals. Replace as needed.  |
|  | Oven control                              | If there is 120VAC supplied to the motor, and the motor, capacitor, and reversing switch check good, replace the oven control.   |
| Conveyor motor runs,<br>but there is no speed<br>display | NOTE: Display will indicate<br>"BELT JAM" |  |
|  | Oven control                              | Check for output voltage from oven control to hall effect sensor (sensor is located in conveyor motor). Measure voltage at the motor connector, red wire and yellow wire. Voltage should be approx. 10VDC. If no voltage is present, trace wiring back to oven control. If there is no voltage present at the oven control, replace the oven control.  |
|  | Conveyor motor                            | If there is voltage supplied to the hall effect sensor, check for a frequency output from the hall effect sensor. Measure frequency across the yellow and white wires at the motor connector. Frequency reading should be approx. 25 – 100 Hz. If these readings are not achieved, replace conveyor motor. If these readings are achieved, proceed.  |
|  | Oven control                              | If the hall effect sensor readings are correct, but there is no speed indicated on the display, replace the oven control.  |

#### REMOVAL, INSTALLATION & ADJUSTMENTS

#### IMPINGER ADVANTAGE SERIES

#### CAUTION!

BEFORE REMOVING OR INSTALLING ANY COMPONENT IN THE IMPINGER OVEN BE SURE TO DISCONNECT ELECTRICAL POWER AND GAS SUPPLY

#### MOTOR, MAIN FAN - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove louvered motor cover from back of oven.
- 3. Remove wireway by taking out the (5) five hex screws.
- 4. Disconnect wiring from motor.
- 5. Remove the twelve (12) hex head bolts from the oven back and slide back straight out of the oven.
- 6. Remove two (2) bolts from fan hub and remove fan from motor shaft.
  - NOTE: Measure distance from fan blade to rear wall assembly before removal to aid in reassembly.
- 7. Remove the eight (8) hex head bolts from the motor mount and slide the motor assembly out of the oven back.
- 8. Remove motor by taking off motor clamp and removing the four (4) mounting nuts and washers.
- 9. Reassemble in reverse order. When motor mount assembly is set on the oven back, align motor shaft in the center of the hole. Set fan assembly on the motor shaft.

NOTE:

- A. Torque specs on bolts (150 in/lb. torque)
- B. It is recommended that an anti-seize compound be brushed on to the bolts around the back and motor mount bracket before assembly.

#### FAN. MAIN - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove back assembly. (See MOTOR, MAIN FAN)
- 3. Reinstall and locate fan so that the bottom of the fan spider is 1 1/2" from the top of the oven back cone. (See Drawing)

#### CAPACITOR, MOTOR - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove motor cover from back of oven.
- 3. Disch arge capacitor.
- 4. Remove and replace.

#### COOLING FAN, CONTROL BOX - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Remove four (4) screws from the fan frame.
- 4. Disconnect cord and plug and remove fan.
- 5. Reassemble in reverse order.

#### THERMOSTAT, COOLING FAN - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Remove lead wires and mark for reassembly.
- 4. Remove two (2) screws and remove thermostat.
- 5. Reassemble in reverse order.

#### **BURNER BLOWER MOTOR - REPLACEMENT**

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Unplug motor connector.
- 4. Remove three (3) screws from blower tube at burner housing.
- 5. Remove air shutter assembly from old motor for installation on new motor assembly.
- 6. Reassemble in reverse order and check system operation.

NOTE: Check air shutter adjustment and adjust if necessary. Set air shutter at approx. 1/4" and adjust to get a blue flame with an occasional tip of yellow under high flame. A view port in the burner assembly should be used to observe flame.

#### BLOWER WHEEL, BURNER

This is part of the burner blower motor assembly.

#### TO REMOVE THE BLOWER WHEEL FOR PERIODIC CLEANING:

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Remove air shutter held by 3 screws.
- 4. Loosen set screws on blower wheel hub and pull straight out.
- 5. Reassemble in reverse order.

NOTE: There is no critical placement of the blower wheel on the motor shaft. Just back as far as it will go and then spin the blower to be sure it is not rubbing.

#### **BURNER CONTROL - REPLACEMENT**

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Remove wires from control, note wire numbers and location for reassembly.
- 4. Remove Two (2) screws from control and replace.
- 5. Reassemble in reverse order and check system operation.

#### **BURNER ASSEMBLY**

- 1. Shut off power at main breaker.
- 2. Shut off gas supply.
- 3. Remove control panel top and front panel.
- 4. Remove gas control valve (See "GAS CONTROL VALVE")
- 5. Disconnect pilot tube.
- 6. Remove solenoid valve. (See "TEMPERATURE REGULATION VALVE")
- 7. Remove four (4) screws that secure the burner backing plate.
- 8. Remove burner assembly from housing, the main and pilot orifice, flame target, pilot shield (main and extension), burner ignitor can now be changed or serviced as needed.
- 9. Reassemble in reverse order. Check all gas line fittings for leaks.

#### GAS CONTROL VALVE - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Shut off gas supply.
- 3. Remove control panel top and front cover.
- 4. Disconnect the gas piping from the back of the unit.
- 5. Remove the four(4) screws from the incoming nipple mounting bracket.

- 6. Remove incoming nipple.
- 7. Remove pilot tube assembly from control valve.
- 8. Disconnect pipe union just above solenoid valve.
- 9. Disconnect wiring from control valve making note of wire numbers and location. Remove piping from old valve for installation on new valve.
- Reassemble in reverse order after assembly is complete, be sure to check manifold pressure (3.5" W.C. NAT GAS 10" W.C. LP) and adjust if necessary. (See Section "MANIFOLD PRESSURE -ADJUSTMENT")

NOTE: Check all gas line fittings for leaks after installation.

#### MANIFOLD PRESSURE - ADJUSTMENT

- 1. Remove control panel top and front cover.
- 2. WITH ELECTRIC POWER AND GAS OFF: Remove the outlet pressure tap plug from the gas control valve and install the adapter fitting and manometer.
- 3. Turn on electric power and gas and start-up oven.
- 4. With oven at full fire, manifold pressure should be (3.5" W.C. NAT/ 10" W.C. LP). If adjustment is needed, remove cover screw from valve body and adjust by turning regulator screw. (C.W. to increase, C.C.W. to decrease).
- 5. Turn off electric power and gas, replace cover screw, remove manometer and adapter; Replace pressure tap plug.
- 6. Check pressure tap for gas leaks before closing panel.
- 7. Close control panel and check system operation.

#### TEMPERATURE REGULATION VALVE - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Shut off gas supply.
- 3. Remove control panel top and front cover.
- 4. Remove gas control valve (See "GAS CONTROL VALVE")
- 5. Disconnect wires from temperature regulation valve.
- 6. Remove two (2) hex nuts that hold main orifice bracket in place.
- 7. Remove temperature regulation valve assembly.
- 8. Remove piping from temperature regulation valve.
- 9. Reassemble in reverse order.
- 10. Check all fittings for leaks.

#### **BURNER IGNITOR - REPLACEMENT**

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Remove burner assembly. (SEE "BURNER ASSY.")
- 4. Remove pilot shield and pilot shield extension.
- 5. Remove burner ignitor.
- Reassemble in reverse order (spark gap approx. .100 in. or 2.5 mm)
   NOTE: Be sure to reconnect burner ignitor cable to ignition control.

#### THERMOCOUPLE - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front cover.
- 3. Slide thermocouple out of oven chamber.
  - NOTE: Remove conveyor and bottom fingers to aid in removal and installation of thermocouple.
- 4. Remove two (2) wires from temperature control. Make note of wire numbers or color and location for reinstallation.
- 5. Reassemble in reverse order making sure the metal end on the thermocouple is in the wire form in the oven chamber.

#### THERMOCOUPLE MEASURMENT

| TEMPERATURE | D.C. MILLVOLTS (APPROX.) |
|-------------|--------------------------|
| 200° 2.8    |                          |
| 250° 4.0    |                          |
| 300° 5.1    |                          |
| 350° 6.0    |                          |
| 400° 7.1    |                          |
| 450° 8.2    |                          |
| 500° 9.3    |                          |
| 550° 10.4   |                          |
| 600° 11.5   |                          |

#### BURNER CONTROL TRANSFORMER - REPLACEMENT

- 1. Shut power off at main breaker.
- 2. Remove control panel top and front cover.
- 3. Remove two (2) wires on primary side, note color and location.
- 4. Remove two (2) wires on secondary side, note color and location.
- 5. Remove two (2) screws from transformer base and replace assembly.
- 6. Reinstall in reverse order and check system operation.

#### CONTROL TRANSFORMER - REPLACEMENT

#### See "BURNER CONTROL TRANSFORMER - REPLACEMENT"

#### CONVEYOR DRIVE MOTOR - REPLACEMENT

- 1. Shut power off at main breaker.
- 2. Remove control panel top and front cover.
- 3. Loosen set screw on conveyor drive sprocket and slide sprocket off shaft.
- Disconnect motor plug.
- 5. Remove four (4) screws from motor frame, on control box side, and remove motor assembly.
- 6. Reassemble in reverse order making sure to align chain sprockets and adjust motor for proper chain tension (1/2" SAG).

#### REVERSING CONVEYOR DIRECTION

All ovens leaving our plant are wired to operate conveyors from left to right. To reverse conveyor direction, use the following procedure.

- 1. Shut off power at oven switch.
- 2. Set conveyor reversing switch in the other position.
- 3. Turn oven "on" and check for proper operation.

#### MAIN ORIFICE - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove control panel top and front panel.
- 3. Remove gas control valve assy.
- 4. Remove two (2) nuts from burner orifice bracket.
- 5. Disconnect pipe union.
- 6. Remove assembly and replace main orifice.
- 7. Reassemble in reverse order and check system operation. NOTE: Check all gas line fittings for leaks.

#### PILOT ORIFICE - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Shut off gas supply.
- 3. Remove burner assembly (See "Burner Assembly").
- 4. Remove pilot line from pilot orifice.
- 5. Remove pilot orifice from burner ignitor.
- 6. Reassemble in reverse order. NOTE: Check all gas line fittings for leaks.

#### **ON-OFF SWITCH - REPLACEMENT**

- 1. Shut off power at main breaker.
- 2. Remove control box cover.
- 3. Remov e access cover.
- 4. Depress spring clips on side of switch and push out.
- 5. Remove wires from back of switch, note wire number and location.
- 6. Reassemble in reverse order and check system operation.
  - NOTE: Make sure switch housing is fully seated in control box housing.

#### **OVEN CONTROL - REPLACEMENT**

- A. Shut off power at main breaker.
- B. Remove control box cover and front panel.
- C. Remove all wiring connections and mark for reassembly.
- D. Remove oven control by pulling control from the mounting pins. Remove control from oven.
- E. Before installing new oven control, set voltage jumper (located at the bottom center of the oven control) to the proper voltage (120V/240V) position. Install the four pushbutton extensions (included with the oven control) by pushing the extensions onto the four set buttons on control.
- F. Reassemble in reverse order and check system operation.
- G. Set the oven control for the proper operating mode. The 1400 series ovens use a single temperature control system. The oven control must be set to the proper operating mode. Set the control as follows: With the oven power switch "off", depress the "time" and "up" buttons and turn the oven "on". Control will indicate "Imp I or Imp II" Release the buttons, The control will indicate "Temp to store". Press the "up" or "down" button until "Imp I" appears on the display. Press the "temp" button. The control is now set for single burner operation.

#### FUSE HOLDER - REPLACEMENT

- 1. Shut off power at main breaker.
- 2. Remove control box cover.
- 3. Remove all wiring from fuse holder and mark for reassembly.
- 4. Remove mounting nut for fuse holder and remove fuse holder.
- 5. Reassemble in reverse order and check system operation.

# GENERAL VIEW ADVANTAGE SERIES

| LETTER | PART NUMBER             | DESCRIPTION   |
|--------|-------------------------|---|
| Α      | 369003                  | Door hinge  |
| В      | See Access Door Section | Access window assembly                                  |
